
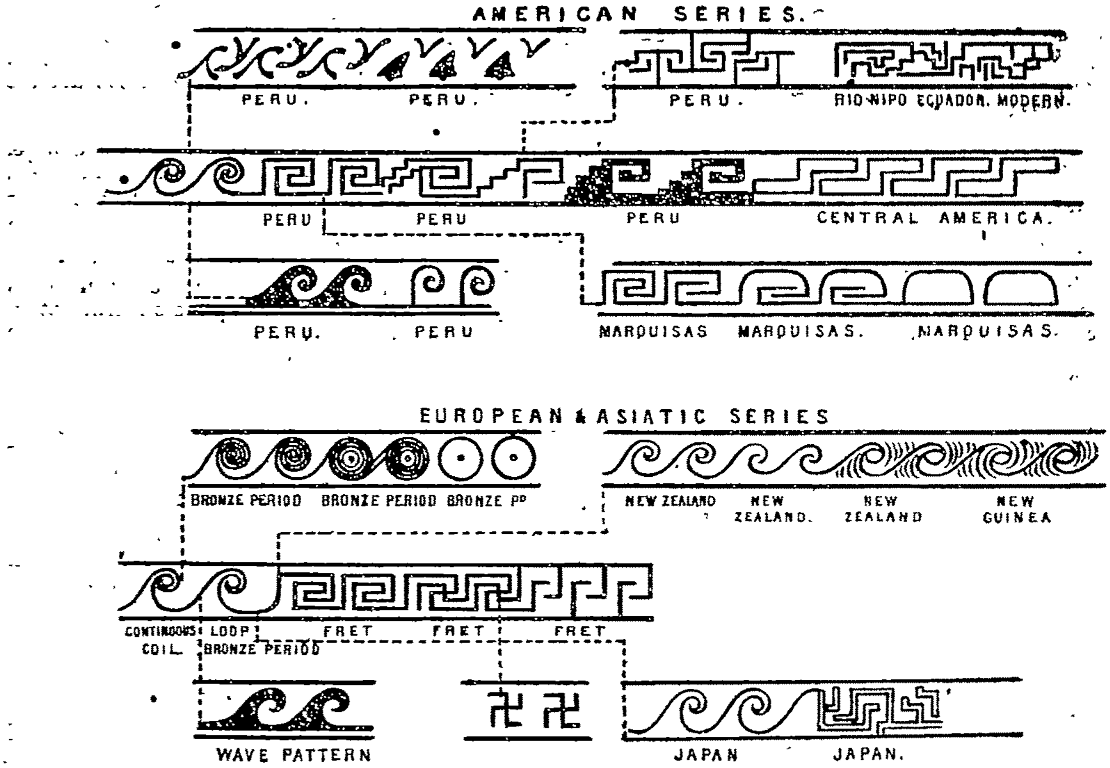

PLATE 4.—Series of diagrams to illustrate the various modifications of the double loop coil ornament in the Old and New Worlds.

Amongst the natives of the North-West coast of America a curious intricate conventional ornament represented on all their paddles and many other objects, is derived from an albatross head, as shown in a series in the collection. A series of curved wooden sharp-edged clubs or glaives show how the form of a fish, to represent which the curved head of the club is carved, degenerates into a single W ornament, the remains of the fish's mouth. Mr. Brooke Low has in his Bornean collection already referred to a series of native fabrics ornamented with elaborate patterns, each of which pattern has a name, usually the name of an animal. One pattern is evidently a representation of a crocodile, it is so named, and others are derived from it. He finds it impossible to determine in many instances by examination from what form the other patterns have been derived, but believes that the history of their origin survives in their names. One name given to them was, for example, "cat," referring to the animal, from a drawing of which the pattern was originally developed. No doubt all the curious patterns in vogue in Polynesia, New Guinea, and elsewhere, have a definite history and meaning yet to be traced. Modern European patterns have also interesting histories to disclose. One of the series in the collection explains the origin of the lozenge- and leaf-pattern common on oak carvings from the intersections of the Gothic arch and ogee arch.

Of the development of ornament from chance marks upon objects, the most interesting example exhibited is probably an Australian boomerang, which happens to have three small round black knots on one side of it placed at equal intervals. The savage owner, struck by the appearance of the knots, burnt a series of similar black marks at equal distances all along the one face of the boomerang, to complete the natural pattern, and then, pleased with his work, put a series of lozenge-shaped marks to correspond on the other side of the weapon. At the Sandwich Islands a most beautiful ornament of the gourds used for water is derived from the net-bag in which the gourds were slung. No doubt the pattern at first became accidentally printed on the gourds, and were afterwards elaborated.

The last series to which we shall draw attention relates to the transformations of the curious ornament which General Pitt Rivers calls the double-loop coil, and which is characteristic of all New Zealand weapons and implements, canoes and houses. The ornament was probably originally copied from coils of string or wire. The distribution of the ornament is very interesting. It is found abundantly in New Guinea, so exactly corresponding to the New Zealand form that it seems certainly to point to some connection between the islanders or partial migration from New Guinea to New Zealand at some time or other, unless some floating object may have conveyed the pattern. A similar ornament occurs in the far-off Marquesas Islands, the natives of which in several other matters of culture show affinity with the Melanesians. It is also very common on Mexican and Peruvian works of art, and especially on gold figures, where it is represented in its former live form by spiral coils of fine wire. From the double-loop coil, as General Pitt Rivers has shown, many other patterns are derived. The fret or key pattern is merely a continuous loop-coil squared. Other patterns, such as the wave pattern, are derived from the coil by slight degeneration. Some of the most marked patterns derived from it are shown in the accompanying figure (Plate 4), which explains itself. It is most curious how nearly parallel the series of modifications attained in the Old and the New World run to one another.

In conclusion we can only express a hope that the Pitt Rivers collection will be accepted by the nation on its generous donor's conditions, and we strongly recommend any of our readers who have not studied it to pay it a long visit at once, and profit by the varied fund of instruction and entertainment which it cannot fail to impart.

THE MASON COLLEGE, BIRMINGHAM

THE Josiah Mason Science College, which is to be opened by an interesting address from Prof. Huxley to-morrow, was begun about five years ago by the venerable and generous donor, Sir Josiah Mason. It is intended to cover ground not occupied by any other of the numerous educational institutions of Birmingham, to which it promises to be an addition of the highest value. The building itself is described as a lofty and spacious Gothic pile, covering about an acre in extent in the very heart of Birmingham.

By its foundation deed the College is established to provide instruction, as far as possible, in mathematics, abstract and applied; physics, both mathematical and experimental; chemistry, theoretical, practical, and applied; the natural sciences, especially geology and mineralogy, with their application to mines and metallurgy; botany and zoology, with special application to manufactures; physiology, with special reference to the laws of health; the English, French, and German languages; and the scheme may, in the discretion of the trustees, include all such other branches of instruction as will conduce to a sound practical knowledge of scientific subjects, excluding mere literary education. The trustees have also power to make provision for instruction in art as well as in science; and, by a supplemental deed, they are authorised to include in the course of study certain subjects requisite for the training of medical students. There is no restriction of the advantages of the college as to sex, creed, or birthplace; but, other things being equal, preference is to be given to candidates who have been educated in Sir Josiah Mason's Orphanage at Erdington, and after these to persons born in Birmingham or Kidderminster, the latter being the founder's birthplace. One wise provision of the deed empowers the trustees, with certain reservations, to alter the course of teaching and the arrangements of the instruction when a change is considered desirable, and at stated intervals the trustees are required to take the arrangements into consideration with a view to revision. At present the branches for which provision is made are confined to mathematics, physics, chemistry, and biology. The mathematical professor is Mr. J. M. Hill, M.A., London, B.A., Cantab, Fellow of University College, London. Physics are taught by Prof. J. H. Poynting, M.A., B.Sc., London, Fellow of Trinity College, Cambridge. The chemistry professor is Mr. W. A. Tilden, D.Sc., London, F.R.S.; and biology is represented by Prof. T. W. Bridge, M.A., F.Z.S. According to present arrangements instruction is provided in the elementary as well as the higher branches of the sciences taught, with a special view to their application to the industries of the Midland district. The course is also designed to prepare students for the degrees of B.Sc. and D.Sc. in the University of London.

The internal arrangements seem to be altogether admirable. The main corridor abuts on two noble apartments, each 48 feet by 30 feet—one intended for the library and reading-room, the other for the physical laboratory—both rooms being provided with ante-rooms. On the first floor, the chief and central room, situated in the front of the building, is the chemical lecture theatre, 50 feet by 33 feet, fitted with seats, tier above tier, for the accommodation of 155 students. The male students will occupy the lower half and the female students the seats above and behind them, a separate entrance being provided for each sex. The mechanical arrangements and apparatus for the use of the lecturer and the carrying away of noxious fumes are of the most complete and ingenious character, and the assistants' ante-room, for the preparation of chemical experiments, is on an equally satisfactory scale. Class-rooms for electricity, magnetism, biology, physics, and models, and a couple of spacious lecture theatres, each 47 feet by 30 feet, one for biology and mathematics, the other for physics, occupy the remaining space on the first floor. The second floor is devoted principally to the chemical departments, for which the arrangements are of the most complete and elaborate character. A large room, 52 feet by 33 feet, in the front of the building, over the chemical lecture theatre, will be used as a general assembly or examination room, and will be available for the meetings of scientific societies. The two laboratories situated at the back of the building, and lit both by windows and skylights, measure together about 104 feet long by 32 feet wide. In the larger laboratory, intended for qualitative analysis, there are four double operating-tables fitted with sinks, gas and water for forty students, in addition to a large unencumbered table in the middle of the apartment for long trains of chemical apparatus. The laboratory for quantitative analysis contains similar fittings and appliances for thirty-two students. On the third floor a large and lofty central room, with open limber roof, partially lit from the roof, is intended for a museum. The basement story, extending under the whole of the ground floor, is lofty and well lighted, and contains store-rooms, rooms for special operations in physics and chemistry, a large room for mineralogy, rooms for living animals, boilers, &c. Altogether the building contains at present about 100 rooms. The heating and ventilating arrangements are upon a somewhat novel plan. Near the centre of the area rises a huge chimney-stack to the height of 160 feet, containing three flues divided by thin partitions. The smoke from the boiler passes off by the central flue and heats the air in the adjoining flues, which are used for ventilating the lecture theatres. The warming is effected by a coil of pipes containing 4,475 superficial feet, and fed with water from the large boiler in a vault in the sub-basement. The arrangements in fact are throughout of the most modern and approved types, having been adopted by the architect after mature consideration of all the best features of the principal scientific colleges in this country and on the Continent, which he visited at the request of the trustees.

The generous founder, who has taken a most active interest in the progress of the work, has built the college and furnished its various departments entirely at his own cost, so that the large endowments previously conveyed to the trustees remain untouched. Sir Josiah Mason has stated that his ambition was to afford all classes in the Midland district, where he had been born and bred, the means of carrying on those scientific studies of which he had felt the want as completely and thoroughly as they can be prosecuted in any of the great science schools of Europe.

We earnestly trust that the noble and benevolent intention of the founder will continue to be carried out, and that in time the institution will become as important and comprehensive a centre of higher education as Owens College is now.

THE PROPOSED LICK OBSERVATORY

MR. S. W. BURNHAM has printed his Report to the Trustees of the "James Lick Trust" of observations made on Mount Hamilton, California, with reference to the location of the observatory, for the erection and endowment of which funds are thereby provided. His object being to test the adaptation of the site for astronomical purposes by observations of double-stars mainly, Mr. Burnham took with him his 6-inch refractor, by Alvan Clark and Sons, which he has used in nearly all his astronomical work, and the excellence of which has been sufficiently proved by the number of difficult double-stars discovered with it during the last six or eight years. He remained on Mount Hamilton from August 17 to October 16, and in this interval was in the observatory on every clear night, with three exceptions. During the first thirty-seven nights he states vision was first-class on all occasions with these exceptions; on two nights the ocean fogs from the valley below reached the summit of the mountain and remained all night, and on two other nights there was only medium steadiness. The kind of weather for astronomical observations during the whole period of sixty days that Mr. Burnham remained at the summit, was forty-two first-class nights, seven medium nights, and eleven cloudy and foggy ones. In the whole interval there was not a single poor night when it was clear. By first-class seeing Mr. Burnham explains that he means "such a night as will allow of the use of the highest powers to advantage, giving sharp, well-defined images, and where the closest and most difficult double-stars within the grasp of the instrument can be satisfactorily measured." The conditions were generally very permanent for the whole night, which is not often the case in ordinary localities. On many nights Mr. Burnham remained at the telescope until daylight, and so had abundant opportunities of noting this important fact.

Having provided himself with a series of cardboard disks, with apertures increasing from one inch up to the full aperture of the object-glass, Mr. Burnham observed a large number of familiar objects, contracting the light until the smaller star was just distinctly visible; many of these objects had been used elsewhere for a similar purpose. He considers some of the observations are remarkable, allowing for the difficulty of the objects with much larger apertures in other localities: μ^2 Herculis (the close pair) was very fairly seen with the full aperture, and the companion of α^2 Capricorni was plain with the aperture contracted to 4 inches, and was seen double with the whole six; these objects Mr. Burnham says he is confident have "never been seen before with so small an object-glass." The fifth and sixth stars of θ^1 Orionis were very plain at an hour-angle of 4½ hours; ζ Herculis was well seen with 3½ in.; and η Cassiopeæ was easy when the aperture was reduced to 1½ inch. Forty-two new double stars were detected, and micrometrical measures of ninety of these objects previously named were put upon record. A great many were examined by daylight, but the air, during the greater part of the day at least, was not found to be steadier than is ordinarily the case elsewhere. It is mentioned, however, that the fifth and sixth stars of the trapezium of Orion were beautifully seen in broad daylight just before sunrise. At the epoch 1879·684 the first measure was made fifteen minutes before sunrise, and "both stars were readily seen for some time after this." Venus was very readily seen with the naked eye at any hour of the day, and easily found without any instrumental indication of its place. Mr. Burnham urges that the new double stars brought to light evidence better than anything else can, what may be done at Mount Hamilton, and remarking that these discoveries were effected with an instrument which in these days of great refractors would be regarded as a comparatively inferior telescope, he considers that it is impossible to overestimate the great discoveries which might be made at this station with a first-class object-glass, such for instance as the Naval Observatory, Washington, already possesses, or the proposed Pulkowa glass of twenty-five times the light-power of the one employed; and according to the terms of the Trust the telescope for Mount Hamilton is required to be "superior to and more powerful than any telescope ever yet made;" a condition, however, which perhaps may not be so easily fulfilled as laid down. Mr. Burnham concludes from his experiences on Mount Hamilton that it "offers advantages superior to those found at any point where a permanent observatory has been established." The station is about fifty miles south of San Francisco and twenty-six miles nearly east of San José, the nearest point of railway connection. The ocean fogs, which might have been feared, were not found to reach the elevation, except rarely. Nearly every night this fog, commencing soon after sunset, comes in from the Pacific between the Golden Gate on the north and the Bay of Monterey on the south, and covers the whole valley, but is ordinarily perhaps 2,000 feet below the summit of the mountain, which has an elevation of 4,250 feet above the level of the sea, and has no sensible effect at such altitude.

It will be seen that Mr. Burnham's knowledge of the locality is confined to the space of two months, but a letter from Prof. Davidson of the U.S. Coast Survey, who has had long experience at other seasons, is appended to the report, which is of a very favourable nature, and Mr. Burnham appears to have no hesitation in advising the adoption of Mount Hamilton as the site of the Lick Observatory, which we may hope will be successful in procuring an instrument worthy of the other great astronomical advantages which it is likely to possess. The geographical position of the observatory peak is in longitude 121° 36′ 40″ W., latitude 37° 21′ 3″ N.

THE UNITED STATES WEATHER MAPS FOR OCTOBER AND NOVEMBER 1878

THE WEATHER MAP for OCTOBER 1878, which appeared in our issue of August 19, showed an area of barometric depression overspreading the whole of the United States except a narrow patch extending from Great Salt Lake northwards. The depression was deepest in the region of Minnesota, where it was 0·150 inch under the average, stretching thence in a west-south-west direction toward San Diego, where it was 0·077 inch below the mean. On the Atlantic sea-board of the States, pressure was 0·014 inch in the south and 0·033 inch in the north below the average, and continued relatively low right across the Atlantic, the depression deepening to another minimum over the region including the north-west of Ireland and Scotland, where the greatest defect from the average reached 0·220 inch. This wide-spread depression stretched still further to eastward over the whole of Europe, except the extreme north of Scandinavia, the southern half of Italy, and all Russia, except its north-western provinces; and to southward at least as far as the equator. Another extensive region of low pressure covered the whole of Asia to the south of a line drawn from Shanghai round by Lake Balkash to the Persian Gulf, and extended south-eastward over the whole of the East India Islands and Australasia as far as the east coast of New Zealand, where atmospheric pressure rose to the average of the month. Pressure was also much under the average in Cape Colony and Mauritius.

On the other hand pressure was above the average over the head waters of the Platte and Missouri rivers, and from Vancouver Island northward over the north-west of America, rising to an excess of 0·180 inch in Alaska. But the most important area of high pressure covered Greenland, where it rose in the south to 0·244 inch above the mean, and spread to the south-westward over Labrador, Newfoundland, and the Dominion of Canada as far as Montreal, and to the eastward over Iceland and the north of Scandinavia. A third area of extensive high pressure embraced the southern half of Italy, Greece, Egypt, Syria, nearly the whole of European Russia, and all Asia to the north of the area of low pressure already pointed out.

The distribution of the temperature anomalies of the month were of the simplest character in their relations to this anomalous distribution of the pressure. In the States to westward of the line of greatest barometric depression a reference to the map will show an extraordinary prevalence of strong north-west winds, where, consequently, temperatures were low, the defect from the average being 4°·8 at Winnipeg, 4°·0 on the Platte, 3°·6 on the Lower Columbia, and 2°·6 at San Diego. On the other hand, temperatures were everywhere above the average to the east of the Mississippi, the excess being nearly 5°·0 in the New England States, but only about the third of a degree in Florida in the south, and in Newfoundland in the north.

Turning now to the great depression north-west of the British Islands, winds were northerly in Iceland and South Greenland, and there the temperature was respectively 2°·3 and 1°·1 below the average. Pressure rose higher from west to east over Europe as far as the Ural River, and into Asia as far as the Tobol, where it was fully 0·100 inch above the mean pressure of October. Westerly and southerly winds accordingly ruled, and temperatures were everywhere above the average over this large tract of the earth's surface, the greatest excess being in the basin of the Dnieper, the maximum 7°·6 being recorded at Kiev. Pressure was 0·012 inch in excess of the average in Syria and Egypt, but the northerly winds in Syria indicate a lower pressure southward, and in accordance therewith temperature was 2°·0 at Beyrout and 0°·7 at Alexandria below the mean. From the rivers Ural and Tobol eastward through Siberia to the Sea of Okhotsk, temperatures were at all places below the average, the defect being from 2°·0 to 3°·0 in the basins of the Obi, Yenisei, Amoor, and Peiho.

It has been stated that pressure was 0·244 inch above the average in South Greenland. At the two more northern stations however the excess was only 0·205 inch and 0·112 inch; and in accordance with this diminution of the pressure northwards over Greenland it is to be noted that whilst in the extreme south of Greenland the temperature was below the average, it rose above it at the stations further north successively to 0°·5, 3°·1, and 4°·0.

NOVEMBER, 1878, the U.S. Weather Map for which accompanies this notice, is memorable as the commencement of a period of unprecedentedly cold weather in the British Isles, which was protracted with scarcely even a temporary interruption to the middle of December, 1879.

In the United States pressure was above the mean to westward of the Mississippi and Missouri, the greatest excess, 0·090 inch, being near the sources of the latter river. Over the rest of the States and Canada pressure was under the average, there being at least three distinct centres of greater depression formed in this extensive region, one over Minnesota and Lake Winnipeg; a second along the St. Lawrence valley, and thence northward probably away towards the head of Baffin Bay, the greatest observed defect from the average being 0·131 inch near Anticosti; and a third along the north of the Gulf of Mexico. In Alaska pressure was fully half an inch below the mean of November.

But the most marked feature of the month was the development of a region of high pressure in mid-Atlantic and thence northward over Iceland and Greenland; the greatest excess, 0·362 inch above the average, occurring in the north-west of Iceland. Immediately to eastward an area of low pressure overspread the whole of Europe, rising however to the average on the southern, eastern, and northern, as well as on the western, limits of the continent. Within this extensive depression, just as in the American depression, were developed several centres of still greater depression, viz., in the Baltic, North Sea, north-west of France, and Corsica. Another area of low pressure extended over India, the Philippine Islands, the East Indian Archipelago, Eastern Australia, Tasmania, and New Zealand. Over the whole of the rest of Asia, the north and east of Africa, and the south and west of Australia atmospheric pressure was above the average.

The temperature anomalies in the United States were quite extraordinary. Within and immediately to eastward of the western barometric depression temperatures were from 12°·4 to 13°·7 above the normal for the month, and over this region southerly winds prevailed; whereas immediately to westward, winds were westerly and northerly, and temperature fell to 3°·4 above the normal, and on the Pacific coast to the normal. On the South Atlantic and Gulf States winds were northerly and the temperature only about half a degree above the normal. In connection with the St. Lawrence valley depression, the temperature anomalies were 6°·0 in the Upper Lake region, 4°·0 in Ohio valley, 3°·6 in the Lower Lake region, and 1°·0 in the St. Lawrence valley above the normal.

In the west of Greenland, the pressure anomalies of the three stations proceeding northward were 0·130 inch, 0·048 inch above, and 0·016 inch below the mean, and from the strong southerly winds resulting therefrom the temperature anomalies were respectively 6°·8, 9°·0, and 9°·5, almost rivalling the relative excesses of temperature which made the weather of this month so memorable over large portions of the States. As higher pressures ruled to westward from the North Cape to the Straits of Gibraltar, strong northerly winds swept over the whole of Western Europe, and the temperature everywhere fell below the average of the season, the defect being 4°·3 in the north of Norway, 4°·0 in Faro, 4°·4 in Islay, 2°·8 in Jersey, and 5°·6 in Portugal. This area of low temperature stretched eastward into Europe as far as Vienna, Trieste, and Mentone.

To the east of the line of lowest pressure within the great barometric depression which covered all Europe except its extreme outskirts, temperatures were above the average, and greatly so as far east as the head waters of Yenisei, and thence round by Taschkend, Syria, and the north of Africa. Over the greater portion of this broad region the excess was not less than 5°·0, and in the north of the Black Sea it reached as high as 9°·4 above the normal. In Eastern Siberia, Mantchooria, and Northern China very low temperatures prevailed, a deficiency of 8°·1 being recorded on the Upper Amoor.

The chief features of the meteorology of the northern hemisphere for November, 1878, and they are very striking, were these :—(1) The almost unprecedently high temperature, amounting to from 6°·0 to 13°·7 above the average over a large part of the United States, from 6°·8 to 9°·5 above the average over West Greenland; an excess of from 5°·0 to 9°·5 over nearly the whole of European Russia and Western Siberia; (2) large and extensive barometric depressions formed in conjunction with these most anomalous temperatures; and (3) the formation of an area of high pressure—inclosed within remarkably steep gradients of mean monthly pressure—over mid-Atlantic, extending thence in a north-easterly direction over Iceland toward Spitzbergen. To this it may be added that, whilst the high temperature anomaly of the surrounding low pressure regions rose to 13°·7 in the United States, 9°·5 in Greenland, and 9°·4 in Europe, the low temperature anomaly of the included region of high pressure fell only to 5°·6 below the normal at Coimbra, but over no great extent did it fall lower than 4°·0 below the normal.

The U.S. Weather Maps for December, 1878, and subsequent months, when low temperature anomalies were their out-standing features, will be looked forward to with the greatest interest as likely to throw light on the development of the meteorological conditions which impressed so arctic a character on our British weather during 1878–79. In connection with this large problem it is impossible to overestimate the vital importance of a serious and searching inquiry into the causes which brought about the high temperature anomalies of the United States, Greenland, and Russia. It is to these anomalies in all likelihood we must look for an explanation of the origin of the high pressure in the included region of the North Atlantic, which was undoubtedly the immediate cause of the strong northerly winds and low temperatures which then prevailed over Western Europe.

NOTES

PROF. W. CHANDLER ROBERTS, F.R.S., will deliver the introductory lecture to his course of Metallurgy, on Monday next, October 4, at three o'clock, at the Science Schools, South Kensington Museum.

MR. A. C. HADDON, Demonstrator of Comparative Anatomy in the University of Cambridge, with the sanction of the authorities, instead of conducting his class as usual during the Long Vacation at Cambridge, made the novel experiment last summer of taking it to the shores of Torbay, where he established a temporary zoological station on the principle of that at Naples, whither he himself had formerly been sent by the University to study. The attempt was very successful, and will doubtless be repeated another year. It was found that in addition to the ordinary class-fee of one guinea, a fee of four guineas covered the expenses of the extemporised laboratory, which was sufficiently provided with the instruments and appliances requisite in the present state of zoological study, as well as those of boat-hire for the dredging and surface-skimming excursions that formed the chief outdoor-work of the class, throughout the seven weeks of its stay; while embryological and histological dissections, together with the preparation and preservation of marine specimens for the University Museum, afforded constant occupation at home. The books, mostly monographs, needed for the determination and proper examination of the animals captured, were supplied by the superintendent of the museum, Mr. J. W. Clark, and the class received much valuable assistance from Mr. A. R. Hunt, whose intimate knowledge of the fauna of Torbay was freely placed at its disposal.

MR. MCGIBBON, the Superintendent of the Botanic Gardens, Cape Town, South Africa, a position which he has filled for thirty years, retires on a pension of 150*l.* a year. A movement is on foot to remove the Gardens from their present contracted site in Cape Town itself, and to create in the neighbourhood of the city a botanical establishment more worthy of the seat of South African Government. As a first step the appointment of Director has been offered to the well-known Cape botanist Prof. MacOwan, of Gill College, Somerset East. It is, however, doubtful whether the state of his health will allow of his undertaking it.

ON the 21st inst. there died at his residence in Camberwell, at the advanced age of 89, Charles Johnson, who for more than forty-four years held the post of Professor of Botany at Guy's Hospital. He was editor of Sowerby's "English Botany," author of "Grasses of Great Britain," "British Poisonous Plants," "Ferns of Great Britain," and other valuable contributions to natural history. In early life he took up the study of natural science, being one of the first members of the City Philosophical Society, of which Dr. Faraday and other eminent men were fellow-members. He was a high authority on agriculture and all subjects connected with economic botany.

THE death is announced of Prof. Samuel Stehman Haldeman, Professor of Comparative Philology in the Pennsylvania University, at the age of sixty-eight years. In 1836 he was employed in the geological survey of New Jersey, and in the following year in that of his native State, Pennsylvania. Dr. Haldeman filled the chair of Natural History in the University of Philadelphia and in a Delaware college, and was Professor of Geology and Chemistry to the State Agricultural Society of Pennsylvania prior to accepting the post which he held at his death. Other deaths announced are, on August 27, Dr. Hanstein, Professor of Botany and director of the Botanic Garden at Bonn; and on August 21, Prof. E. B. Andrews, of the Geological Survey of Ohio, the author of several important contributions to the geology of that State.

MR. DARWIN has forwarded to us an article contributed to an American medical journal by Dr. B. G. Wilder, Professor of Physiology in Cornell University, on "The Two Kinds of Vivisection—Sentisection and Callisection;" as he thinks the suggestion therein contained deserves consideration in this country. "All well-informed persons," Dr. Wilder writes, "are aware that the vast majority of vivisections, in this country at least, are performed under the influence of anæsthetics; but the enthusiastic zoolaters, who desire to abolish the objective method of teaching physiology, practically ignore this fact, and dwell chiefly upon the comparatively infrequent operations which are attended with pain." Having read the arguments upon both sides and had some correspondence with leaders of the anti-vivisection movement, I have been led to think that the discussion may be simplified, and a right conclusion sooner reached, if we adopt new terms corresponding to the two kinds of experimentation. Having waited long in the hope that some candid discussion of the whole subject might contain the needed terms, I venture to suggest that painful vivisection be known as *sentisection*, and painless vivisection as *callisection*. The etymology of the former word is obvious; the distinctive element of the latter is the Latin *callus*, which, in a derived sense, may denote a nervous condition unrecognised, strictly speaking, by the ancients. Some idea of the relative numbers of callisectionists and sentisectionists may be gained from the fact that I have been teaching physiology in a university for twelve years, and for half that time in a medical school; yet I have never performed a sentisection, unless under that head should be included the drowning of cats, and the application of water at the temperature of 60° C. (140° F.), with the view to ascertain whether such treatment would be likely to succeed with human beings. I think that even elementary physiological instruction is incomplete without callisection, but that sentisection should be the unwelcome prerogative of the very few whose natural and acquired powers of body and mind qualify them above others to determine what experiments should be done to perform them properly, and to wisely interpret the results. Such men, deserving alike of the highest honour and the deepest pity, should exercise their solemn office not only unrestrained by law, but upheld by the general sentiment of the profession and the public."

AMERICAN papers speak of remarkable clouds of flies that have visited various districts. At East Pictou, Nova Scotia (about 44° 50′ N., 63° W.), such a cloud was seen on August 21. "They passed Lismore about six o'clock in the evening close to the shore. They went with the wind, which was blowing lightly from the west, occupying about twenty minutes passing a given point. They made a loud buzzing noise, which was heard by many who missed seeing them. They flew so low that some of them appeared to fall into the water. About two miles below Lismore they slightly changed their flight, heading more to the north. After their passage numbers of strange flies were observed in some of the houses near the shore. They were about half an inch in length, with wings proportionately longer than those of the common house-fly, but whether they belonged to the swarm is uncertain." At Halifax, Nova Scotia, immense swarms passed over Guysboro' (lat. 44° 40′ N., long. 61° 30′ W.), on September 5. They came from the east and resembled a dark cloud. A communication from Poughkeepsie, New York (lat. 41° 50′ N., long. 74° W.) states that a storm of flies was encountered on the Hudson River on the afternoon of September 4. The steamer *Martin*, bound south, encountered the fly storm between New Hamburgh and Newburgh. It seemed like a great drift of black snow, and it reached southward from shore to shore as far as the eye could reach. There were millions upon millions of the flies, and they hurried northward as thick as snow-flakes driven by a strong wind. They were long and black and had light wings, and the cloud must have been miles in length. Our readers may remember that some weeks ago we recorded a somewhat similar phenomenon as having been seen in various parts of France.

A VERY successful attempt has been made to measure a base-line, near Aarberg, for the triangulation of Switzerland. The first measurement gave 2400·087 metres; the second, made independently of the first, gave 2400·085 metres as the result, the difference between the two being thus only two millimetres. The measurement was made under the direction of the Spanish General Ibanez, who invented the instrument by which the work was done. The place selected for the line is on the Sisselen road, which presents here an almost straight and level line of three kilometres.

A CONGRESS is to be held from October 1 to 10 at Saragossa, to discuss matters relating to the phylloxera.

THE "Elephant Sugar Cane" of Cochin China, which is said, though this requires confirmation, to reach a height of eleven feet and a diameter of seven inches in six months, has been successfully introduced by the Royal Gardens, Kew, from Saigon, into Jamaica. The rather sensational reputation of this variety has excited a good deal of interest in it amongst the West Indian planters.

MR. ROLAND TRIMEN, the Curator of the South African Museum, has arrived in this country.

THE Annual Report of the Smithsonian Institute for 1878 shows that it continues to be as active as ever in the advancement of scientific knowledge. In all its departments a vast amount of work has been done during the year, much of this work being really of an international character. Many valuable additions were made to the National Museum during the year, and several monographs of the first importance published. One of the principal papers in the volume is a memoir of the late Prof. Joseph Henry, by Prof. Asa Gray. About 100 pages are devoted to a paper by Mr. W. B. Tayler on "Henry and the Telegraph," and another long paper describes Henry's researches on sound, with special reference to fog-signalling. Other papers are a translation of Arago's biography of Condorcet; Ernest Favre's biographical notice of Louis Agassiz; "The Effect of Irritation of a Polarised Nerve;" "Pfluger's Electrotonus," by Dr. B. F. Lautenbach; "Researches on Fever," by Dr. H. C. Wood; "Constants of Nature," by Prof. John LeConte; list of apparatus relating to heat, light, electricity, magnetism, and sound, available for scientific researches involving accurate measurements, in various institutions in the United States; "Ornithological Exploration of the Caribbee Islands," by Mr. F. A. Ober; "Report of Explorations in Greenland," by L. Kumlein.

VOL. XVI. of the *Transactions and Proceedings* of the Royal Society of Victoria contains the results of a very satisfactory year's work. The following are among the papers in this volume:—"On the Relation between Forest Lands and Climate in Victoria," by R. L. J. Ellery, F.R.S.; "Experiments on the Tensile Strength of a few of the Colonial Timbers," by Fred. A. Campbell, C.E.; "The Diorites and Granites of Swift's Creek and their Contact Zones, with Notes on the Auriferous Deposits," by A. W. Howitt, F.G.S.; "On the Genus Amathia of Lamaroux, with a Description of a New Species," by the Rev. J. E. Tenison-Woods, F.G.S., &c.; "Notes on the Customs of Mota, Banks Islands," by the Rev. R. H. Codrington, M.A., Oxford, with Remarks by the Rev. Lorimer Fison, Fiji; "Some New Localities for Minerals in Victoria," by J. Cosmo Newberry; "The Tidal Datum of Hobson's Bay," by R. L. J Ellery, F.R.S.; "Notes on the Geology of the West Tamar District, Tasmania," by Norman Taylor; "Observations of the Outer Satellite of Mars in 1879," by E. J. White, F.R.A.S. Williams and Norgate are the London agents of this Society.

THE Government of India has offered the prize of 100*l.* for the best "Manual of Hygiene," to serve as a text-book for the use of the British soldiers in that country. Works submitted in competition for this prize must be sent in by their authors to the Secretary to the Government of India in the Military Department at Calcutta, so as to reach his hands not later than the last day of next March. The work is "to be written in clear and simple English, and thoroughly practical, showing the ordinary causes affecting health, and the special dangers to which British soldiers are exposed in India, more particularly during their first year in the country, and the best means by which those dangers may be averted." The work, if accepted, will be printed at the public expense, and become the property of the State; and it is not to exceed in bulk "more than fifty or sixty pages of print, of small pica, octavo size."

AN ingenious method for obviating the frequent stoppage of trains at stations, and yet accommodating the passengers from these stations, has been devised by M. Hanrez. A "waiting carriage," comprising a steam-engine with special gear, and space for passengers and luggage, is placed on a siding at the station, and picked up by the train as it goes past. The latter, by means of a hook on its last carriage, catches a ring supported on a post, and connected with a cable wound on a drum in the waiting carriage. Thereupon the drum begins to unwind, and in doing so compresses a system of springs, while the carriage is moved at a rate gradually increasing to that of the train. The engine of the carriage then winds in the cable, the train and carriages are connected, passengers are transferred (the carriages being of the American type) from the joined carriage to the train, and *vice versa*, then the two are disconnected, and the engine of the carriage, working on the wheels, brings it back to the station whence it was taken.

MR. R. TUCKER writes:—A verification of M. Landry's statement (NATURE, vol. xxii. p. 495) may be acceptable:—

$$2^{2^6} + 1 = 2^{64} + 1 = 18446744073709551617$$
$$= 274177 \times 67280421310721.$$

THOSE of our readers who have girls to educate we recommend to consult the Queen's College Calendar for 1880–81, published by Macmillan and Co.

THE Sanitary Institute seems to have had a very successful meeting last week, all the usual topics embraced in its programme coming on for discussion. Dr. B. W. Richardson gave a very interesting and instructive lecture on "Woman as a Sanitary Reformer," one of the first conditions being her education in physiology and such other sciences and arts as bear on every-day household life. Dr. Richardson made it clear that if women were educated as they ought to be they would be an immense power in keeping houses and households in a healthy condition.

WE have received the new calendar of the Newcastle College of Science. The classes in this institution now include mathematics, experimental physics with laboratory, chemistry with laboratory, geology, including geological surveying, natural history, land surveying, mining, modern history, French, German, mechanical drawing.

ABOUT 88,000*l.* has now been subscribed towards the cost of the projected new University College at Liverpool, and little more will be needed to make up the amount required. It was originally intended to raise 80,000*l.* for the endowment of seven professorships and two lectureships; but part of the money subscribed (about 7,000*l.*) has been contributed towards the foundation of a Roscoe chair of art—a professorship not originally contemplated; Lord Derby gives 10,000*l.* to found a chair of natural history; Messrs. William, S. G., and P. H. Rathbone give a like sum to found a King Alfred chair of modern history and literature; Mr. A. H. Brown, M.P., and Messrs. Cressfield and Barrow also give 10,000*l.* to found a chair of ancient history; Mrs. Grant subscribes a similar amount to found a chair in some branch of science; and 10,000*l.* is given by the trustees of the late Mr. Roger Lyon Jones to the Royal Infirmary School of Medicine, to found a chair of experimental physics, with which mathematics will be for the time associated. Between 7,000*l.* and 8,000*l.* has been subscribed towards founding a chair of philosophy, logic, and political economy. Though the endowment funds are nearly complete, there remains the cost of a building to be provided.

WE have received from Madras Dr. Oppert's work "On the Weapons, Army Organisation, and Political Maxims of the Ancient Hindus, with special reference to Gunpowder and Firearms."

THE Aristotelian Society, which was founded last spring for the systematic study of philosophy, has just completed its work for this session, having studied philosophy from Thales to Proclus. The session for 1880-81 will open on October 11 at 20, John Street, Adelphi, at 8 p.m., when an introductory address will be delivered by the President, Mr. Shadworth H. Hodgson, LL.D., on "Philosophy in Relation to its History." During the session the Society intends to study mediæval philosophy, and the whole of modern philosophy, from Bacon to Comte and Spencer.

A SOCIETY for the Promotion of Agricultural Science has been formed in the United States, which will meet annually for the reading of papers, and which will in other ways endeavour to encourage scientific research in connection with agriculture. Such papers as are likely to be of permanent value will be published. Prof. W. J. Beal of Lansing, Michigan, is president of the society.

AT the last meeting of the Balloon Society a letter was read from M. de Fonvielle offering to bring over a balloon with a gas capacity of 42,000 feet, and compete with Mr. Wright in his balloon, both balloons to start simultaneously from the Crystal Palace in a contest for the longest aërial distance travelled in some particular direction. The proposal was referred to a committee.

WE have received a handsome quarto publication, "Contributions to the Archæology of Missouri, by the Archæological Section of the St. Louis Academy of Science." This first part is devoted to Pottery; it will be followed by others, the object being to furnish to those interested in the archæology of the country, a reliable statement of facts connected with the occurrence of prehistoric remains in this important region. The present volume contains a general description of the south-eastern Missouri district and of the pottery which has been found in such abundance in the burial mounds of that region. Several charts and plans and figures of characteristic specimens of the pottery, beautifully drawn and lithographed, have been selected for illustration. The authors of the two papers in the volume are Mr. W. B. Potter and Dr. E. Evans. Should the present venture meet with encouragement other volumes may soon be expected treating of "Implements," "The Construction and Grouping of Earthworks," and "Osteological Remains." We trust the enterprise will meet with the encouragement it well deserves. The volume is published by George A. Bates, Naturalists' Bureau, Salem, Mass.

AN unusually severe shock of earthquake was felt at Fribourg on Sunday, the 19th inst., about 11 a.m. A smart earthquake shock was felt at Morat at 8 o'clock, a.m., on the 21st, and another twelve hours later at Fribourg, which, though of shorter duration than that of Sunday, caused considerable alarm. An earthquake took place at Wellington, New Zealand, on July 28.

A SILESIAN Botanical Exchange Club has been established, evidently intended for the exchange of specimens among botanists of all countries. A copy of the rules may be obtained by applying to Herr Adolph Toepffer, Bandenburg an der Havel, Prussia.

DR. HECTOR, of the New Zealand Geological Survey, expresses his opinion that in Westland and Otago vast auriferous racts remain as yet untouched.

"The Monthly Index to Current Periodical Literature, Proceedings of Learned Societies, and Government Publications," published at the office of the *American Bookseller*, New York, seems to us a very useful publication.

The passage of the meteor referred to in Mr. Thwaites' letter last week, occupied one and a half, not eleven and a half seconds.

The additions to the Zoological Society's Gardens during the past week include a Macaque Monkey (*Macacus cynomolgus*) from India, presented by Major Gape; an Egyptian Jerboa (*Dipus ægyptius*) from Egypt, presented by Dr. Hastings; a Cape Bucephalus (*Bucephalus capensis*) from South Africa, presented by Mr. C. B. Pillans; two Black-faced Spider Monkeys (*Ateles ater*) from East Peru, a Southern River Hog (*Potamochærus africanus*) from South Africa, a Razor-billed Curassow (*Mitua tuberosa*) from Guiana, a Yarrell's Curassow (*Crax carunculata*) from South-East Brazil, a Blue and Yellow Macaw (*Ara ararauna*), two Orinoco Geese (*Chenalopex jubata*) from South America, two Rufous Tinamous (*Rhynchotus rufescens*) from Brazil, deposited; a Common Rhea (*Rhea americana*) from South America, a Spotted-billed Toucanet (*Selenidera maculirostris*) from Brazil, an Electric Silurus (*Malapterurus beninensis*) from West Africa, purchased.

BIOLOGICAL NOTES

Transverse Commissure in Arthropods.—From a recent memoir laid before the Belgian Academy by M. Lienard (*Archives de Biologie*, tom. i. fasc. 2), it would appear that an arrangement of the cephalic nerve-centres, hitherto thought to have been peculiar to Crustacea, is really to be found in nearly the whole of the Arthropoda. It has been long known that in Crustaceans, *e.g.*, Decapoda, besides the super and sub-œsophagean ganglionic masses and their lateral connections, there is a well-marked transverse commissure, situated in front of the sub-œsophagean mass, and immediately behind the œsophagus. This commissure in other Arthropoda seems, from quite technical causes, to have escaped notice. M. Lienard finds it nearly everywhere among the Myriapoda, Coleoptera, Odonata, Lepidoptera, Hemiptera, Diptera (nymphs and larvæ). He has dissected the complete ring in nearly 100 forms, belonging to 70 genera. He is trying to ascertain the origin of the fibres which form the transverse commissure.

The Hæmatopœtic Function.—In a recent paper to *R. Accademia dei Lincei*, Sig. Fleti describes the effects of splenotomy as observed by him in dogs. Some of these are as follows:—Immediately after the operation (the previous *régime* of life being maintained) the quantity of hæmoglobin increases for a short time, and more in old than in young animals. Next it diminishes much and progressively in old animals, but without reaching half the normal quantity. In a third phase there is a slow progressive increase, which by degrees brings the quantity up to and above the normal. In young animals the diminution is much less, and the quantity of hæmoglobin sooner reaches and surpasses the normal. In all cases the weight of the animal does not diminish, but may even considerably increase (under good hygienic and alimentary conditions). Sig. Fileti adds some chemical observations as to colorations obtained with hydrochloric acid and yellow prussiate of potash. It clearly appears (he concludes) that, the spleen being removed, the marrow of the bones does not compensate for its function. As the quantity of hæmoglobin first increases—and we cannot admit a real increase in production as resulting from splenotomy—we must suppose that in this brief period the failure of the spleen makes itself felt more in destruction than in production. The former of these functions comes to be compensated more quickly, and there is then a gradual diminution in production of hæmoglobin as a direct consequence of the spleen being absent, and this diminution is greater the less able the marrow is to act, *i.e.* the older the animal. When, finally, the hæmatopœtic function of the spleen has been completely compensated by the marrow of the bones, the quantity of hæmoglobin returns to the normal figure, and may even surpass it. Sig. Fileti is studying the influence of light on the production of hæmoglobin.

Development of Lepidosteus.—In an interesting memoir read at the last meeting of the British Association (Swansea) Prof. F. M. Balfour and Mr. W. N. Parker gave the results of their investigations of some larval forms of Lepidosteus which had been most liberally supplied to them by Prof. Alexander Agassiz. Some of the more important of these were:—1. That the segmentation was, as in the sturgeon, complete, but the larger segments of the lower pole very early fused together to form a yolk sac. 2. That the epiblast was divided into nervous and epidermic layers, and that the nervous system was formed by a solid thickening of the epiblast, as in Teleostei, and not by the closure of a groove, as in the sturgeon. 3. That the lens of the eye and auditory vesicle were developed from the nervous layer of the epidermis. 4. That the general relation of the embryo to the yolk, and the general characters of the germinal layers are precisely like those in Teleostei. 5. That there is present a suctorial disk in front of the mouth, with numerous papillæ, as was first noticed by Agassiz; this disappears in the adult, and is probably a persisting rudiment of a primitive vertebrate organ, remains of which are also found in the adhesive papillæ of larval ascidians, the adhesive disks of larval amphibians, &c.

Visceral Anatomy of Herring.—Mr. F. W. Bennett calls attention to the following, it would seem new, fact in the visceral anatomy of this common fish (*Journ. Anat. and Physiol.*, July, 1880). It possesses an extremely long air-bladder, which stretches towards to the head, terminating near the labyrinth of the auditory organs. About the middle of its length it is connected by a duct with the stomach. The latter is capacious and elongated; while the commencement of the mid-gut is near the gullet the posterior portion of the stomach continues on into the ductus pneumaticus. This communication will be found most usually closed with mucus; but Mr. Bennett points out that there is another and a more important communication between the air-bladder and the cloaca. Till within one half-inch of this latter the air-bladder retains its well-known and beautiful silvery appearance; this then suddenly ceases, and the remainder of the bladder is muscular. This will account perhaps for its having been overlooked so long; what the exact uses of this passage may be are not yet known, but it is certain that it affords freer passage for gas than the duct leading into the stomach. Bristles may be readily passed through it, and gas may be made to bubble out if slight pressure be carefully applied under water. The usual arrangement of the apertures of the cloaca is as follows:—In front lies the anus, then the generative aperture, and hindmost of all, the urinary duct opens; the opening of the duct now described by Mr. Bennett lies between the anus and the urinary aperture, and usually to the left of the genital aperture.

Monstrous Beetles.—Mr. Horace F. Jayne has recently published, in the *Trans.* American Entom. Soc., vol. viii. pp. 155–62, Pl. IV., descriptions of some monstrosities observed in North American Coleoptera, all of which belong to that class to which the terms "Monstra per excessum" and "Monstres polyméliens" have been applied. They belong to the genera *Calosoma, Cychrus, Metrius, Pasimachus, Scarites, Dyschirius, Chlænius, Lichnanthe, Polyphylla, Strategus, Telephorus, Prionus, Eleodes*, and *Helops*, and form an interesting addition to the already numerous recorded instances of this kind of monstrosity in beetles. All show a tendency to reduplication in some of the cephalic or thoracic appendages. In some it is the antennæ, in others the palpi, in others the legs, that are thus affected, and in some cases the tendency is exhibited in more than one of these appendages in the same individual. Beetles appear to be particularly liable to the production of such monstrosities, but it is probable that no parallel instance like that here recorded and illustrated by Mr. Jayne in an example of a longicorn beetle (*Prionus californicus*) has been noticed. In it each maxillary palpus has two terminal joints, and each femur has two perfectly-formed tibiæ and tarsi, with the claws, &c., the whole monstrous development being remarkably symmetrical; the labial palpi and the antennæ are normal, as is all the rest of the insect. Mr. Jayne contents himself by describing and figuring these interesting monsters, and does not venture upon any suggestions as to causes, in which he is perhaps wise, considering the uncertainty that exists as to the origin of parallel monstrosities in animals far higher in the scale. Reduplication of cephalic, thoracic, and probably abdominal appendages in the Arthropoda is by no means rare, but it is possible that a distinct combination of two individuals more or less united in one, such as is sometimes found in vertebrates, does not exist.

DIGESTION IN PLANTS.—Dr. Lawson Tait has recently investigated afresh the Digestive Principle of Plants. While he has obtained complete proof of a digestive process in *Cephalotus*, *Nepenthes*, *Dionæa*, and the *Droseraceæ*, he entirely failed with *Sarracenia* and *Darlingtonia*. The fluid separated from *Drosera binata* he found to contain two substances, to which he gives the names "droserin" and "azerin." Dr. Tait confirms Sir J. D. Hooker's statement that the fluid removed from the living pitcher of *Nepenthes* into a glass vessel does not digest. A series of experiments led him to the conclusion that the acid must resemble lactic acid, at least in its properties. The glands in the pitchers of *Nepenthes* he states to be quite analogous to the peptic follicles of the human stomach; and when the process of digestion is conducted with albumen, the products are exactly the same as when pepsine is engaged. The results give the same reactions with reagents, especially the characteristic violet with oxide of copper and potash, and there can be no doubt that they are peptones.

STIPULES IN ONAGRACIÆ.—Prof. Baillon says (*Bull. mensuel. Soc. Lin. de Paris*, No. 33) that in the majority of works on descriptive botany, this family is mentioned as characterised by the constant absence of stipules, and in justification of this quotes the classical works of Decaisne, Duchartre, Endlicher, and Hooker; nevertheless he states that the existence of these organs in this family admits of easy proof, not indeed that they ever occur of large dimensions, for then they could not have escaped detection, but still they are present, more commonly as little subulate tongue-like bodies, acute, often red-coloured at the base of the petioles in both opposite and alternate-leaved plants. In Hauya they soon turn black and wither off early. In the fuchsia of our gardens little stipules are often present. In Circea they can also be detected. In the Lopezia of our gardens all the leaves have two very distinct stipules, which indeed have been often referred to in botanical works, and it is the same with Haloragia, though Bentham and Hooker describe them as here absent.

A NEW GREEN CILIATED PLANT.—Under the title of "A New Ciliated Organism furnished with Chlorophyll," Prof. van Tieghem has published (*Bull. Soc. Bot. France*, 1880, p. 130) a memoir of a strange new form. The organism in question was found by Prof. Perrier twice: once at Roscoff, in sea-water containing algæ and some of the lower animals; and again at the Museum (Paris), in a little aquarium in the laboratory. It presents the appearance of a gelatinous tremulous mass of a pure green colour; in outline well defined, spherical or oval in shape, attaining more than a centimetre in diameter, and attached by a portion of its periphery to a large marine alga. At first sight it would be called a Nostoc. Exposed to sunlight it gave out oxygen, so one concludes its colouring-matter to be chlorophyll. On a closer inspection it is seen that the mass is composed of a colourless jelly, scattered throughout which are isolated green points, visible to the unassisted eye, and sufficiently numerous as to give to the whole mass the green coloration distinguishing it, so one would not now refer it to Nostoc. Each little green body is spherical, and measures from three to four-tenths of a millimetre. It is formed of a very finely granular and somewhat dark protoplasm, very uniformly permeated with an amorphous chlorophyll; neither nuclei nor vacuoles, nor red spot were detected, and the surrounding membrane was very thin. At one place (called the pole) the cell bore a tuft of vibratile cilia which were attached side by side, so as to cover a space more or less large according to age and to allow of independent movements. On the equator at two diametrically opposite points a small hollow in the green mass is seen, and by these passes a band of homogeneous protoplasm which traverses the membrane, turning towards the pole, and in the superior hemisphere dividing on its outer border into fine fringes with vibratile cilia. These cilia are confluent at their base, and are not independent in their movements. In process of development the polar cilia become detached (absolutely fall off), next the lateral moustaches disappear (these seem to be retracted), a continuous membrane covers over all, but the general aspect and dimensions remain unchanged. Later on the cell divides into two (equatorially), next it divides again (perpendicularly), and the segmentation continues until there is a family of sixteen rounded-off cells, and the organism has passed through a phase of encystment. Lastly each daughter cell increases in size, separates more and more from its neighbour, gets closed in a fine membrane, and then appears all covered over with cilia. It now escapes into the water and secretes in abundance a gelatinous material. The clothing of cilia drops off as the form approaches its adult size: soon appear the polar cilia, next the lateral moustaches; and so far its life-history is complete. At no phase in its development was either cellulose detected in its cell-membrane, nor starch in its protoplasm. Prof. van Tieghem concludes:—"Is this organism an animal or a plant? I am not well able to say, and I must add besides that this question, to which formerly so much importance attached, in the actual condition of science, appears to me to be destitute of interest." It is called *Dimystax perrieri*. With every respect to the dictum of so distinguished a botanist as Prof. Tieghem, we venture to call our readers' attention to this strange form, which M. Roze seems disposed to regard as an animal, in the hopes that some of them may assist in determining its proper position in nature.

PHYSICAL NOTES

A FRESH measurement has been made by Mr. T. C. Mendenhall of the acceleration of gravity at Tokio, an account of which appears in the *American Journal of Science*. The experiments were made after the accepted methods with Kater's and Borda's pendulums, the only novelty introduced being that of employing a chronograph in connection with a reliable chronometer to determine the time of vibration of the pendulum. At every sixtieth or hundredth vibration of the pendulum a light break-circuit apparatus placed beneath it was raised to just such a height as to be "thrown" by the pendulum at its lowest point of swing, thus enabling its rate to be calculated to the ten-thousandth of a second. Mr. Mendenhall considers his determinations to be more reliable than those of Professors Ayrton and Perry, which were made with a long wire pendulum; he revises their calculations, altering their value of "g" from 9·7974 to 9·7979, and asserts that their calculation of the theoretical value by Clairaut's formula is wrong, and should be 9·7980, not 9·797 (metres). His own determinations give a mean result of 9·7984.

A SECONDARY battery, the electrodes of which consist of porous fragments of gas-carbon, has been devised by M. Henri Sauvage. Though inferior in power and durability to a perfectly "formed" Planté cell with lead electrodes, this cell would be cheaper, more readily and rapidly constructed, and would yield a current of longer duration. The action is probably due to the occlusion of the hydrogen and oxygen gases respectively in the pores of the carbon. The inventor recommends that the two plates used as electrodes be kept apart with a simple thin wooden frame.

PROF. O. N. ROOD calls attention to the fact that when the colour of ultramarine blue is mixed with white by the method of rotating disks the tint appears to verge towards violet. Brücke advanced the explanation that what we call white is really a reddish colour. Aubert, on the contrary, regarded it as showing that violet is only a pale shade of ultramarine blue. A series of experiments made with other colours showed that when mixed thus with white green-yellow becomes greenish, and green green-bluish, that full yellow and orange incline to red, and red becomes purplish. These observations accord with neither theory, and Prof. Rood advances none himself. He thinks that the fact as it stands explains why it is impossible in the polariscope to produce a red free from purplish tint, there always being white light mingled with the red rays.

PROF. J. TROWBRIDGE, in investigating with telephones connected to earth-plates the flow of return-currents through "earth," found that at a mile from the Harvard College Observatory the time-signals of the observatory clock could be heard by merely tapping the earth at points fifty feet apart.

FROM his recent researches on dilatation and compressibility of gases under strong pressures, M. Amagat derives (*Comptes rendus*, August 30) the following laws:—1. The coefficient of dilatation of gases (for temperatures not too much above the critical) increases with the pressure to a maximum, then decreasing indefinitely. 2. This maximum occurs under the pressure with which the product $p\,v$ is minimum, where the gas accidentally follows Mariotte's law. 3. It diminishes for higher and higher temperatures, and at length disappears. 4. At a sufficiently high temperature the compressibility of fluids is represented by the formula $p\,(v - \alpha) = \text{const.}$; α being the smallest volume the mass of fluid can occupy; this is the limiting law. For each gas α has a special value. 5. For pressures below the critical the deviation (from Mariotte's law), first positive for a temperature sufficiently low, becomes *nil*, then negative, with increasing temperature; but beyond a certain negative value it diminishes indefinitely without changing sign. 6. For pressures between the critical pressures and a superior limit, special for each gas, the period during which the deviation is positive is preceded at a lower temperature by a period in which it is negative; so that the deviation twice changes sign. 7. Beyond the upper limit of pressure indicated in the preceding law the deviation is always negative, whatever the temperature; it diminishes, in general, when the temperature increases, except for pressures near the limit, where its variation is more complicated.

IT is known that rain and other meteoric waters contain a quantity of gas and saline matters which they find in the atmosphere and carry with them. The amount varies with the seasons, but may be estimated, on an average, at about 8 cc. of oxygen, and 0·50 to 0·60 cc. carbonic anhydride per litre, along with small quantities of ammonia, nitrite, nitrate, and carbonate of ammonium, organic matters, and chloride of sodium. In a recent paper to the Belgian Academy M. de Koninck holds that in the alteration and metamorphism of rocks by infiltration of those waters may be found the solutions of many questions in geology hitherto unsolved. The facts he cites relate to tertiary and quaternary deposits which in many parts of Belgium are so transformed by the waters in question that it is impossible to recognise them if account be taken only of petrographic characters.

FROM observing how different persons gave different estimates of the apparent size of blood-corpuscles seen in the microscope, M. Montigny was led to make a series of further experiments on the subject (which are described in the *Bulletin* of the Belgian Academy, No. 6). He comes to the conclusion that even for good observers an estimation of the kind referred to is principally affected by the length of distinct vision, but that often this appreciation is subject to the influence of occult causes which affect the relation between sensation and judgment. The examination of microscopic objects may be influenced, like astronomical observations, by a kind of *personal error*, by reason of which individuals have a tendency to see microscopic images, some larger, others smaller, than they should appear, abstraction being made of the influence of the length of distinct vision on our appreciations. These conclusions, it is pointed out, do not at all affect the exactness of measurements determined by *savants* with the microscope, but they tend to show that each observer should measure for himself the different magnifying powers of the instrument he uses, obtained by changes of eye-pieces and objectives.

WITH the view of demonstrating the mechanical action of electrolysis, all action of heat being excluded, Signor Basso has lately experimented thus (*Il Nuovo Cim.*, ser. 3, tom. vii.). A thin square glass plate is covered with collodion, and on this when dry is put a thin layer of good gelatine, mixed with about $\frac{1}{10}$ of its weight of a saturated solution of bichromate of potash. The bare side of the plate is exposed to light, to attach the gelatine layer. Then the plate is put in an aqueous solution of chloride of gold till the upper layer is impregnated with the gold salt, and it is exposed to diffused daylight. Next the covered side is strewed with fine graphite, and the glass connected by means of four fine wires running along its sides to the negative pole of a battery. The plate is then placed in an ordinary bath of sulphate of copper. The copper is deposited regularly on the whole of it. In a few days wrinkles and bubbles appear; and if the copper have been deposited as far as the borders, the plate may at length even break, thus proving the mechanical force, which is a direct consequence of electrostriction.

ON THE PRESENT STATE OF SPECTRUM ANALYSIS[1]

AT the Sheffield meeting of the British Association a committee was appointed to report on the present state of spectrum analysis. The committee has this year presented its first report. The report is divided into four parts:—

1. On the spectra of metalloids, drawn up by Dr. A. Schuster.
2. On the influence of temperature and pressure on the spectra of gases, drawn up by Dr. A. Schuster.
3. On the emission spectra of the rays of high refrangibility, drawn up by Prof. W. N. Hartley.
4. On the absorption spectra of the rays of high refrangibility, drawn up by Prof. A. K. Huntington.

In the report on the spectra of metalloids, we have for each element a full account of the literature on the subject with all necessary references. The various spectra of each metalloid and its compounds are enumerated, and special stress is laid on the discussion which nearly always has taken place on the chemical origin of these spectra. It will be found that often more work is needed to clear up doubtful points, but there is no special controversy at issue at the present moment except in the case of the carbon spectra. A discussion of very long standing is still occupying the minds of many spectroscopists as to whether the spectrum which is seen at the base of every candle flame is due to carbon or to a hydrocarbon. The arguments and experiments on either side are given in detail and are finally summed up as follows:—"Those who believe the spectrum to be due to the element carbon rely chiefly on the brilliancy with which these bands are developed when cyanogen is burnt in oxygen, also when the spark is taken in cyanogen, carbon tetrachloride, and carbonic oxide at high pressure; all the gases being dried with the greatest care. Those who oppose this view and who hold that the spectrum is due to a hydrocarbon refer to the impossibility of excluding all traces of moisture, and to the fact that this spectrum is well developed under circumstances where we know hydrocarbons to be present."

When cyanogen is burnt a series of bands appears in the blue violet and ultra-violet, and another controversy has taken place whether these bands are due to carbon or to a compound of carbon and nitrogen. Two papers have lately appeared on the subject. One by Mr. Lockyer, in which he describes an experiment in which the bands were seen in a spark taken in carbon tetrachloride, although the nitrogen lines were not visible in the jar discharge; and another by Professors Liveing and Dewar, in which these bands were traced to impurities of nitrogen in all cases in which they were seen. A spark in carbonic oxide showed the bands when the gas was prepared from ferrocyanide of potassium, but not when it was made by heating a mixture of quicklime with pure and dry potassium oxalate. When all the air had been properly expelled a tube containing carbon tetrachloride did not show the bands.

The following quotation will give an idea of the points which are discussed in the second report:—

"We shall endeavour for clearness' sake to arrange our material under five different heads. We shall first discuss what changes we have a right to expect in the appearance of a spectrum, if the quantity of luminous matter is increased or if the temperature is raised, the absorbing properties of the gas remaining unaltered. We shall next speak of the widening of lines, which, as we shall see, often accompanies an increase of pressure. Then we shall treat of the different spectra given by one and the same body at different temperatures; and we shall see how far satisfactory explanations have been offered for their existence.

"So far our road will be clear; but we shall see that these spectra of different orders, as they have been called, are only extreme cases of continuous changes which are nearly always going on. Very often we can refer these continuous changes to a gradual displacement of one spectrum by another; but often we shall not be able to prove the existence of a second spectrum. There is *à priori* nothing impossible or even improbable in the view that the relative intensity of different lines may be different at different temperatures, and often when we observe a variation we may equally well explain it by assuming the gradual appearance of a new spectrum or an alteration only in the relative intensities of the lines. It becomes then a matter of extreme difficulty to decide which of the two suppositions is correct. In doubtful cases we may often be able to obtain important information by means of a method which is little understood even by spectroscopists. It is the method which has first been extensively used and investigated by Mr. Lockyer of projecting an image of the luminous source, spark, arc, or flame on the slit of the spectroscope and thus localising the spectra, which are thrown and confused together if the luminous source is examined directly without the interposition of a lens. We shall see how by means of this method we shall often at a single glance be able to tell how the body will behave at different temperatures and under different pressures. Many facts which have been quoted as remarkable might have been foretold by means of this method. Our fourth chapter will be devoted to it. In our last chapter we shall have to give an account of some changes which have not found a place under the previous heads."

---

[1] Abstract of Report read at the Swansea meeting of the British Association.

Space will only permit us to quote a few of the questions raised. It is now generally admitted that pressure is the principal cause which determines the widening of lines, but it is not generally known that a different appearance of the lines may be presented according as the pressure is due to the impact of similar or dissimilar molecules; thus a molecule of sodium will widen its lines more easily in an atmosphere of sodium than in another atmosphere. Mr. Lockyer has observed that the lines of oxygen or nitrogen may be obtained sharp at atmospheric pressure by mixing a small quantity of one gas with the other. The gas which is present in small quantities has its lines sharp.

The curious fact is mentioned that when a line widens unsymmetrically it widens in nearly all cases more towards the red, and then towards the violet end.

In that part of the report which relates to multiple spectra an account is given of the gradual spreading of the opinion that these spectra are due to different molecular groupings. The question of long and short lines is next discussed, and great stress is laid on the fact that the longest lines are by no means always the strongest. An abstract of Mr. Lockyer's work on the subject is given, and of the confirmation which his results have found in later work. Thus Mr. Lockyer found that the longest lines were always the first to be reversed. Professors Liveing and Dewar have since examined the absorption-spectra of many metallic vapours. The lines which they have seen reversed were nearly in all cases those which are longest in the spark, though not always those which are strongest. Results obtained by M. Lecoq de Boisbaudran with sparks, the temperature of which was lower than in the ordinary jar-discharge, also confirm Mr. Lockyer's results. Discussing the attempts which have been made to explain these and other facts, it is again mentioned that we must assume the impacts of a similar molecule to produce a greater effect than the impacts of a dissimilar one. The last part of the report treats of some other changes in the relative intensities of lines. We only mention the experiments in which Mr. Lockyer found sometimes the green sodium line to be present without the well-known yellow double line. The report concludes as follows:—

"We have here again two hypotheses, that of molecular shocks and that of molecular combinations. Both explain the facts satisfactorily, and I do not think that one of them necessarily excludes the other. I believe, on the contrary, that a line can be drawn, and that while the regular changes observed chiefly in band-spectra may be due to one cause, the often irregular changes in metallic spectra, where one set of lines disappears and another appears often on the violet side, but sometimes towards the red, may be due to another cause.

"It is often said that we must not ascribe the same phenomenon to two different causes, when one of them is sufficient to explain it; but the point at issue is whether the phenomena are the same in all cases. An advance of science has constantly led to the separation of phenomena which were formerly considered to be connected together, and we believe that the further development of the different points we have attempted to discuss, in which different observers have strongly taken up opposite opinions, will lead to the blending together of different views rather than the entire elimination of one of them."

Prof. Hartley, in his part of the report, gives us an account of our knowledge on emission spectra in the ultra-violet region. He treats especially of the researches on the solar spectrum by Mascart, Draper, and Cornu.

Prof. A. K. Huntington reports on the absorption spectra in the ultra-violet region. The results obtained by Prof. Stokes and Dr. Miller are given in detail. Amongst the results obtained by Dr. Miller, it seems especially interesting to notice the connection which apparently exists between the absorbing properties of a liquid and that of its vapour. When one of them is transparent to the ultra-violet rays the other is also, and *vice versâ*.

Prof. Soret, it is well known, constructed a few years ago a spectroscope with a fluorescent eyepiece, and has by means of it carried researches in the ultra-violet parts of the spectrum. We notice especially the examination of absorption-spectra of the bases of gadolinite, and the conclusions drawn from it on the existence of new elementary bodies. Prof. Cornu has given much attention to the absorption power of our atmosphere, and we find a full account of his experiments in Prof. Huntington's report. In conclusion we have a short abstract of the work done by Professors Hartley and Huntington on absorption-spectra in the ultra-violet region. They obtained the following results:—

1. The normal alcohols of the series $C_4H_{2n-1}OH$ are remarkable for transparency to the ultra-violet rays of the spectrum, pure methylic alcohol being nearly as much so as water.

2. The normal fatty acids exhibit a greater absorption of the more refrangible rays of the ultra-violet spectrum than the normal alcohols containing the same number of carbon atoms.

3. There is an increased absorption of the more refrangible rays corresponding to each increment of CH_2 in the molecule of the alcohols and acids.

4. Like the alcohols and acids, the ethereal salts derived from them are highly transparent to the ultra-violet rays, and do not exhibit absorption-bands.

Interesting results were also obtained by the examination of substances containing the benzene nucleus, and in a separate paper the absorption-spectra of essential oils were examined and discussed. Prof. Hartley has still further extended the researches jointly begun with Prof. Huntington, and has arrived at the conclusion that no molecular arrangement of carbon atoms causes selective absorption, unless three pairs are doubly linked together in a closed chain.

It will be seen that a few only of the branches of spectrum analysis have been discussed in the present report, and next year no doubt will bring us a further instalment of a work which we hope will prove useful to those who are interested in spectroscopic investigations.

AGRICULTURAL CHEMISTRY[1]

III.

I HAVE thus far directed attention to some points of importance in connection with the sources of the constituents of our crops, and I must now briefly refer to some in connection with the composition, and to some relating to the uses, of the crops themselves.

As to composition, I must confine myself to indicating something of what is known of the condition of the nitrogen in our various crops; though I had intended to say something respecting the carbohydrates, and especially respecting the various members of the cellulose group.

As to the nitrogen—in our first experiments on the feeding of animals, made in 1847, 1848, and 1849, the results of which were published in the last-mentioned year—we found that, in the case of succulent roots used as food, not only were they not of value as food in proportion to their richness in nitrogen, but when the percentage of it was higher than a certain normal amount, indicating relative succulence and immaturity, they were positively injurious to the animals. So marked was the variation of result according to the condition of maturity or otherwise of of the foods employed, that, when reviewing the results of the experiments which had up to that time been conducted, in a paper read before this Section of the British Association at the Belfast meeting in 1852 (and which was published in full in the annual volume[2]), we stated that the mode of estimating the amount of proteine compounds by multiplying the percentage of nitrogen by 6·3 was far from accurate, especially when applied to succulent vegetable foods, and that the individual compounds ought to be determined. The Rothamsted laboratory staff was however much smaller then than it is now, and with the pressure of many other subjects upon us, it was at that time quite impossible to follow up the inquiry in that direction.

It is indeed only within the last ten years or so that the question has been taken up at all systematically; but we are already indebted to E. Schulze, A. Urick, Church, Sachsse, Maercker, Kellner, Vines, Emmerling, and others, for important results relating to it.

Our knowledge in regard to the subject is however still very imperfect. But it is in progress of investigation from two distinctly different points of view—from that of the vegetable physiologist and that of the agricultural chemist. The vegetable physiologist seeks to trace the changes that occur in the germination of the seed, and during the subsequent life-history of the plant, to the production of seed again. The agricultural chemist takes the various vegetable products in the condition in which they are used on the farm, or sold from it. And as a very large proportion of what is grown, such as grass, hay, roots, tubers, and various green crops, are not matured productions, it comes to be a matter of great importance to consider whether or not any large proportion of the nitrogenous contents of such products is in such condition as not to be of avail to the animals which consume them in their food?

---

[1] Opening Address in Section B (Chemical Science), at the Swansea meeting of the British Association, by J. H. Gilbert, Ph.D., F.R.S., V.P.C.S., F.L.S., President of the Section. Continued from p. 490.

[2] "On the Composition of Foods in relation to Respiration and the Feeding of Animals."

We cannot say that the whole of the nitrogen in the seeds with which we have to deal exists as albuminoids. But we may safely assume that the nearer they approach to perfect ripeness the less of non-albuminoid nitrogenous matters will they contain; and in the case of the cereal grains at any rate, it is probable that if really perfectly ripe they will contain very nearly the whole of their nitrogen as albuminoids. With regard to some leguminous and other seeds, which contain peculiar nitrogenous bodies, the range may however be wider.

But whatever the condition of the nitrogenous bodies in the seeds we grow or sow, with germination begins a material change. Albuminoids are transformed into peptones, or peptone-like bodies, or degraded into various amido- or other compounds. Such change into more soluble and more diffusible bodies is, it is to be supposed, essential to their free migration, and to their subserviency to the purposes of growth. In the case of the germination, especially of some leguminous seeds, asparagine has been found to be a very prominent product of such degradation of the albuminoids; but it would seem that this disappears as the green parts are developed. But now the plant begins to receive supplies of nitrogen from the soil, as nitrates or ammonia, and it would seem that amides constitute a considerable proportion of the produced nitrogenous bodies, apparently as an intermediate stage in the formation of albuminoids. At any rate, such bodies are found to exist largely in the immature plant; whilst the amount of them diminishes as the plant, or its various parts, approach to maturity.

But not only have we thus, in unripened vegetable productions, a greater or less, and sometimes a very large, proportion of the nitrogenous bodies formed within the plant, existing as amido-compounds, but we may have a large amount existing in the juices as nitric acid, and some as ammonia, &c. Thus, E. Schulze determined the nitric acid in various "roots;" and he found that, in some mangels, more than one-third of the total nitrogen existed in that form, and about one-tenth as much as ammonia. In a considerable series at Rothamsted, we have found an extremely variable proportion existing as nitric acid, according to the size, succulence, or degree of maturity, of the roots; the amount being, as a rule, the least with the ripest and less highly nitrogenous roots, and the most with the most succulent, unripe, and highly nitrogenous ones. In some cases it reached as much as from 20 to nearly 30 per cent. of the total nitrogen. In many other immature vegetable products nitric acid and ammonia have been found; but, so far as I remember, in none in anything like so large a proportion as in the so-called "root-crops," especially mangels. In many, however, the quantity appears to be immaterial; and it is remarkable that whilst there is so much in the "roots," little or none is found in potatoes.

No wonder that, in the experiments already referred to, we found the feeding result to be the worse the more succulent and immature the roots, and the higher their percentage of nitrogen, accordingly.

But it is to the difference in amount of the albuminoid bodies themselves, in different descriptions of vegetable produce, that I wish specially to direct attention, making, however, some reference to what is known of the proportion of the nitrogen existing as amido-compounds.

In some mangels E. Schulze found only from about 20 to 22 per cent. of their total nitrogen to exist as insoluble and soluble albumin. But he found in one case 32·5, and in the other 40·8 per cent. of the total nitrogen as amides. In a large series of determinations at Rothamsted, by Church's method, we found a variation of from under 20 to over 40 per cent. of the total nitrogen of mangels to exist as albuminoids; or, in other words, from nearly 60 to over 80 per cent. of it in the non-albuminoid condition.

In potatoes Schulze found from under 50 to 65 per cent. of the total nitrogen as soluble and insoluble albumin, and from 27·7 to 49·1 per cent. as neutral and acid amides. In a series of potatoes grown at Rothamsted, under very various conditions as to manuring, and in two different seasons, we found the nitrogen as albuminoids to range from little over 50 to more than 71 per cent. of the total nitrogen, leaving, of course, from less than 30 to nearly 50 per cent. to be accounted for in other ways.

Kellner determined the amount of nitrogen as albuminoids, and as amido-compounds, in a considerable series of green foods, both leguminous and gramineous, cut at different stages of their growth. The proportion of the total nitrogen not as albuminoids was, upon the whole, greater in the leguminosæ than in the gramineæ. In both, however, the proportion as albuminoids increased as the plants approached to maturity. The proportion as albuminoids was in all these products very much larger than in roots, and generally larger than in potatoes. In the case of first-crop meadow-hay we found in the separated gramineous herbage 76·4, in the leguminous herbage 82, and in the miscellaneous herbage 80·3 per cent. of the nitrogen as albuminoids; and in the second crop 86·2 per cent. in the gramineous, 88·3 per cent. in the leguminous, and 88·1 per cent. in the miscellaneous herbage. How far the higher proportion of the nitrogen as albuminoids in the second crops is to be taken as any indication of the characteristics of the autumn growth, or how far it is to be attributed to the accidental condition of the weather, may be a question.

These illustrations are sufficient to give some idea of the range and proportion of the nitrogen in different feeding crops which does not exist as albuminoids; and they are sufficient to show that a very large proportion of the non-albuminoid matter exists as various amido-compounds. The question arises, therefore, whether these bodies contribute in any way to the nutrition of the animals which feed upon them? We have but little experimental evidence on this point. As green herbage is the natural food of many descriptions of animal, we might suppose that characteristic constituents of it would not be without some value as food; but the cultivated root crops are much more artificial productions, and it is in them that we find such a very large proportion of non-albuminoid nitrogen. With respect to some of the amido compounds, at any rate, direct experiments seem to show that they are digested in the animal body, and increase the elimination of urea. Weiske and Schrodt found that rabbits receiving, as their only nitrogenous food, either asparagine or gelatin, wasted and died; but a rabbit receiving both asparagine and gelatin increased in weight and survived to the end of the experiment, which lasted seventy-two days. From the results of other experiments made with sheep, they concluded that both asparagine and gelatin protect the albuminoids of the body from oxidation.

These considerations lead me, in conclusion, to refer briefly, and I promise it shall be as briefly as is consistent with clearness, to the two very much disputed questions of *the origin of muscular power*, and *the sources of the fat of the animal body*. These subjects Mr. Lawes and myself have frequently discussed elsewhere; but as the controversy has assumed a new phase quite recently it seems desirable and appropriate that I should recur to it on the present occasion.

With regard to the question of the sources in the food of the fat of the animal body, Liebig originally maintained that although fat might be formed from the nitrogenous compounds within the body, the main source of it in the herbivora was the carbohydrates. In his later writings he sharply criticised the experiments and arguments of those who have maintained the formation of fat chiefly from the proteine compounds, but he at the same time seems to attach more importance to that source than he formerly did. He gives it as his opinion that the question cannot be settled by experiments with herbivora. He adds that what we know with certainty is that, with these animals, albuminates and carbohydrates work together to produce fat; but whether the non-nitrogenous product, fat, has its origin in the albumin or in the carbohydrate he considers it not easy to determine.

At the time when we commenced our experiments on the feeding of animals in 1847 the question whether the fat of the animals fed for human food was mainly derived from albuminoids or from carbohydrates had been scarcely raised, or at least it was not prominent. The question then was rather—whether the herbivora received their fat ready formed in their food, or whether it was produced within the body—the latter view being that which Liebig had so forcibly urged, at the same time maintaining that at any rate its chief source was the carbohydrates. Accordingly our experiments were not specially arranged to determine whether or not the whole of the fat produced could or could not be derived from the albuminoids.

For each description of animal, oxen, sheep, and pigs, such foods as had been established by common experience to be appropriate were selected. The general plan of the experiments was to give to one set a fixed amount of a recognised good food, containing known quantities of nitrogen, fatty matter, &c., to another set the same amount of another food, of different characters in these respects; to other sets also fixed amounts of other foods in the same way: and then there was given to the whole series the same complementary food *ad libitum*. Or, to one set was supplied a uniform food rich in nitrogen, and to others uniform foods poorer in nitrogen, and so on, in each case *ad libitum*.

It will be seen that in this way a great variety of dietaries was arranged, and it will be observed that in each case the animals themselves fixed their consumption according to the requirements of the system.

As already indicated, the individual nitrogenous and non-nitrogenous compounds of the foods were not determined. As a rule, the constituents determined were—the total dry matter, the ash, the fatty matter, and the nitrogen; from which last the amount of nitrogenous compound it might represent was calculated by the usual factor. But, as already said, the results so obtained were only used with considerable reservation, especially in the case of all immature vegetable produce. Nor was the crude fibre determined; but, as in the case of the estimated nitrogenous substance, when interpreting the results, it was always considered whether or not the food contained much or little of probably indigestible woody matter.

The animals being periodically weighed, we were thus able to calculate the amounts of the so-estimated nitrogenous substance, and of the total non-nitrogenous substance, including and excluding fat, consumed—*for a given live-weight within a given time*, and *to produce a given amount of increase in live-weight*.

Experiments were made with a large number of sheep and a large number of pigs. And, even without making allowance for the different condition of the nitrogenous or of the non-nitrogenous constituents, in comparable foods, the results so uniformly indicated that, both the amount consumed by a given live-weight of animal within a given time, and that required to produce a given amount of increase, were determined much more by the amount of the non-nitrogenous than by that of the nitrogenous constituents which the food supplied. And when allowance was made for the different condition of the nitrogenous constituents, and for the greater or less amount of the non-nitrogenous ones which would probably be indigestible and effete, the indications were still more remarkable and conclusive.

In very many cases the animals were slaughtered, and carefully examined as to whether the tendency of development had been more that of growth in frame and flesh, or in fatness. Here, again, the evidence was clear, that the tendency to growth in frame and flesh was favoured by a high proportion of nitrogen in the food, and that to the production of fat by a high proportion of digestible non-nitrogenous constituents.

In a few cases the actual amount of fat in the animals in the lean, and in the fat condition, was determined; and the results admitted of no doubt whatever that a very large proportion of the stored-up fat could not have been derived from the fatty matter of the food, and must have been produced within the body.

So decisive and consistent were the very numerous and very varied results in regard to these points, that we had no hesitation in concluding—not only that much of the fat stored up was produced within the body, but that the source of much, at any rate, of the produced fat must have been the non-nitrogenous constituents of the food—in other words, the *carbohydrates*.

As already stated, however, as the question whether the source of the produced fat was the proteine compounds or the carbohydrates was not then prominent, we had not so arranged the experiments as to obtain the largest possible increase in fat with the smallest possible supply of nitrogenous compounds in the food, nor did we then even calculate whether or not there was sufficient nitrogenous matter consumed to be the source of the whole of the fat produced.

This question, indeed, excited very little interest, until, at a meeting of the Congress of Agricultural Chemists held at Munich in 1865 (at which I happened to be present), Prof. Voit, from the results of experiments made in Pettenkofer's respiration apparatus with dogs fed on flesh, announced his conclusion that fat must have been produced from the nitrogenous substance, and that this was probably the chief, if not the only, source of the fat, even of herbivora—an opinion which he subsequently urged much more positively.

In the discussion which followed the reading of Prof. Voit's paper, Baron Liebig forcibly called in question his conclusions; maintaining not only that it was inadmissible to form conclusions on such a point in regard to herbivora, from the results of experiments made with carnivora, but also that direct quantitative results obtained with herbivorous animals had afforded apparently conclusive evidence in favour of the opposite view.

Voit's paper excited considerable controversy, in which Mr. Lawes and myself joined. We maintained that experiments to determine such a question should be made not with carnivora or omnivora fed on flesh, but with herbivora fed on their appropriate fattening food, and on such herbivora as common experience showed to be pre-eminently fat-producers. We pointed out[1] that the pig comprised, for a given live-weight, a comparatively small proportion of alimentary organs and contents; that, compared with that of the ruminants, his food was of a high character, yielding, for a given weight of it, much more total increase, much more fat, and much less necessarily effete matter; that, in proportion to his weight, he consumes a larger amount of food, and yields a larger amount, both of total increase and of fat, within a given time; and, lastly, that he contains a larger proportion of fat, both in a given live-weight and in his increase whilst fattening.

It is obvious that with these characteristics there is much less probable range of error in calculating the amount and the composition of the increase in live-weight in relation to the amount and composition of the food consumed, than in the case of ruminants; and that therefore the pig is very much more appropriate for the purpose of experiments to determine the sources in its food of the fat it produces.

Accordingly we calculated a number of our early experiments made with pigs, to determine whether or not the nitrogenous substance they consumed was sufficient for the formation of the fat they produced. For simplicity of illustration, and to give every possible advantage to the view that nitrogenous substance might have been the source of the produced fat, we assumed the whole of the crude fat of the food to have been stored up in the animal—thus estimating a minimum amount to be produced. Then again we supposed the whole of the nitrogenous substance of the food to be perfectly digested, and to become available for the purposes of the system. Lastly, after deducting the amount of nitrogenous substance estimated to be stored up as such, the whole of the remainder was reckoned to be so broken up that no other carbon-compounds than fat and urea would be produced.

The result was that, even adopting these inadmissible assumptions in all the cases in which, according to common experience, the food was admittedly the most appropriate for the fattening of the animal, the calculation showed that a large amount of fat had been produced which could not have been derived from the nitrogenous substance of the food, and must therefore have had its source in the carbohydrates. Such a result is moreover entirely accordant with experience in practical feeding.

Reviewing the whole subject in great detail in 1869, Prof. Voit refers to these results and calculations. He confesses that he has not been able to get a general view of the experiments from the mass of figures recorded, and from his comments he shows that he has on some points misunderstood them. He admits, however, that as the figures stand, it would appear that fat had, in some instances, been derived from the carbohydrates. Still, he says, he cannot allow himself to consider that a transformation of carbohydrates into fat has thus been proved.

Prof. Emil von Wolff again in his "Landwirthschaftliche Futterungslehre," referring to the same experiments, admits that they are almost incomprehensible unless we assume the direct concurrence of the carbohydrates in the formation of fat. He nevertheless seems to consider that evidence of the kind in question is inconclusive; and he suggests that experiments with pigs should be made in a respiration apparatus to determine the point.

Mr. Lawes and myself entertained, however, the utmost confidence that the question was of easy settlement without any such apparatus, provided only suitable animals and suitable foods were selected. I, accordingly, gave a paper on the subject in the *Section für Landwirthschaft- und Agricultur-Chemie*, at the Naturforscher Versammlung, held at Hamburg in 1876.[1] The points which I particularly insisted upon were—that the pig should be the subject of experiment; that he should be allowed to take as much as he would eat of his most appropriate fattening food, so that his increase, and the fat he produced, should bear as large a proportion as possible to his weight, to the total food, and to the total nitrogenous substance consumed. Finally, it was maintained that, if these conditions were observed and the constituents of the food determined, and those of the increase of the animal estimated according to recognised methods, the results could not fail to be perfectly conclusive without the intervention either of a respiration apparatus or of the analysis of the solid and liquid matters voided.

---

[1] "On the Sources of the Fat of the Animal Body," *Phil. Mag.*, December, 1866.

Results so obtained were adduced in proof of the correctness of the conclusions arrived at. We at the same time admitted that although, for reasons indicated, we had always assumed that fat was formed from the carbohydrates in the case of ruminants as well as of pigs, yet, as in our experiments with those animals we had supplied too large amounts of ready-formed fat, or of nitrogenous matter, or of both, it could not be shown so conclusively, by the same mode of calculation in their case as in that of pigs.

In the discussion which followed, Prof. Henneberg agreed that it seemed probable that fat could be formed from the carbohydrates in the case of pigs. In the case of experiments with other animals, however, the amount of fat produced was too nearly balanced by the amount of fat and albuminous matters available, to afford conclusive evidence on the point.

Quite recently Prof. Emil von Wolff (*Landwirthschaftliche Jahrbücher*, Band viii. 1879, Supplement) has applied the same mode of calculation to results obtained by himself with pigs some years ago. He concluded that the whole of the body fat could not have been formed without the direct co-operation of the carbohydrates of the food. But what is of greater interest still is that he also calculated in the same way the results of some then quite recent experiments of Henneberg, Kern, and Wattenberg, with sheep. He thus found that, even including the whole of the estimated amides with the albumin, there must have been a considerable production of fat from the carbohydrates; and, excluding the amides, the amount reckoned to be derived from the carbohydrates was of course much greater.

I will only add, on this point, that on recalculating some of our early results with sheep, which did not afford sufficiently conclusive evidence when the whole of the nitrogen of the food was reckoned as albumin, show a very considerable formation of fat from the carbohydrates if deduction be made for the probable amount of non-albuminoid nitrogenous matter of the food.

We have now, then, the two agricultural chemists of perhaps the highest authority, both as experimenters and writers on this subject on the continent, giving in their adhesion to the view, that the fat of the herbivora, which we feed for human food, may be, and probably is, largely produced from the carbohydrates. I dare say, however, that some physiologists will not change their view until Voit gives them sanction by changing his, which, so far as I know, he has not yet done.

The question which has been currently entitled that of "The Origin of Muscular Power," or "The Sources of Muscular Power," has also been the subject of much investigation, and of much conflict of opinion, since the first publication of Liebig's views respecting it in 1842.

As I have already pointed out, he then maintained that the amount of muscular tissue transformed, the amount of nitrogenous substance oxidated, was the measure of the force generated in the body. He accordingly concluded that the requirement for the nitrogenous constituents of food would be increased in proportion to the increase of the force expended. In his more recent writings on the subject, he freely criticises those who take an opposite view. He nevertheless grants that the secretion of urea is not a measure of the force exerted; but, on the other hand, he does not commit himself to the admission that the oxidation of the carbohydrates is a source of muscular power.

The results of our own early and very numerous feeding experiments were, as has been said, extremely accordant in showing that, provided the nitrogenous constituents in the food were not below a certain rather limited amount, it was the quantity of the digestible and available non-nitrogenous constituents, and not that of the nitrogenous substance, that determined—both *the amount consumed by a given live-weight within a given time*, and *the amount of increase in live-weight produced.* They also showed that one animal, or one set of animals, might consume two or three times as much nitrogenous substance in proportion to a given live-weight within a given time as others in precisely comparable conditions as to rest or exercise. It was further proved that they did not store up nitrogenous substance at all in proportion to the greater or less amount of it supplied in the food, but that the excess reappeared in the liquid and solid matters voided.

So striking were these results, that we were led to turn our attention to human dietaries, and also to a consideration of the management of the animal body undergoing somewhat excessive labour, as, for instance, the hunter, the racer, the cab-horse, and the foxhound, and also pugilists and runners. Stated in a very few words, the conclusion at which we arrived from these inquiries (which were summarised in our paper given at Belfast in 1852) was, that unless the system were overtaxed, the demand induced by an increased exercise of force was more characterised by an increased requirement for the more specially respiratory, than for the nitrogenous, constituents of food.

Soon afterwards, in 1854, we found by direct experiments with two animals in exactly equal conditions as to exercise, both being in fact at rest, that the amount of urea passed by one feeding on highly nitrogenous food was more than twice as great as that fed on a food comparatively poor in nitrogen.

It was clear therefore that the rule which had been laid down by Liebig, and which has been assumed to be correct by so many writers, even up to the present time, did not hold good—namely, that "The sum of the mechanical effects produced in two individuals in the same temperature is proportional to the amount of nitrogen in their urine; whether the mechanical force has been employed in voluntary or involuntary motions, whether it has been consumed by the limbs or by the heart and other viscera"—unless, indeed, as has been assumed by some experimenters, there is, with increased nitrogen in the food, an increased amount of mechanical force employed in the "involuntary motions" sufficient to account for the increased amount of urea voided.

The question remained in this condition until 1860, when Bischoff and Voit published the results of a long series of experiments made with a dog. They found that, even when the animal was kept at rest, the amount of urea voided varied closely in proportion to the variation in the amount of nitrogenous substance given in the food—a fact which they explained on the assumption that there must have been a corresponding increase in the force exercised in the conduct of the actions proceeding within the body itself in connection with the disposal of the increased amount of nitrogenous substance consumed. Subsequently, however, they found that the amount of urea passed by the animal was, with equal conditions as to food, &c., no greater when he was subjected to labour than when at rest; whilst, on the other hand, the carbonic acid evolved was much increased by such exercise. They accordingly somewhat modified their views.

In 1866 appeared a paper by Professors Fick and Wislicenus, giving the results obtained in a mountain ascent. They found that practically the amount of urea voided was scarcely increased by the labour thus undertaken. Prof. Frankland gave an account of these experiments in a lecture at the Royal Institution in the same year; and he subsequently followed up the subject by an investigation of the heat developed in the combustion of various articles of food, applying the results in illustration of the phenomena of the exercise of force.

Lastly, Kellner has made some very interesting experiments with a horse at Hohenheim, the results of which were published last year. In one series the experiment was divided into five periods, the same food being given throughout; but the animal accomplished different distances, and drew different weights, the draught being measured by a horse-dynamometer. The changes in live-weight, the amount of water drunk, the temperature, the amount of matters voided, and their contents in nitrogen, were also determined.

The result was that with only moderate labour there was no marked increase in the nitrogen eliminated in the urine; but that with excessive labour the animal lost weight and eliminated more nitrogen. Kellner concluded, accordingly, that, under certain circumstances, muscular action can increase the transformation of albumin in the organism in a direct way; but that, nevertheless, in the first line is the oxidation of the non-nitrogenous matters—carbohydrates and fat, next comes in requisition the circulation-albumin, and finally the organ-albumin is attacked.

In reference to these conclusions from the most recent experiments relating to the subject, we may wind up this brief historical sketch of the changes of view respecting it, with the following quotation from our own paper published in 1866:[1]—". . . all the evidence at command tended to show that by an increased exercise of muscular power there was, with increased requirement for respirable material, probably no increased production and voidance of urea, unless, owing to excess of nitrogenous matter in the food, or a deficiency of available non-nitrogenous substance, or diseased action, the nitrogenous constituents of the fluids or solids of the body were drawn upon in an abnormal degree for the supply of respirable material."

---

[1] The substance of that communication is given in the *Journal of Anatomy and Physiology*, vol. xi. part iv.

In conclusion, although I fully agree with Voit, Zuntz, Wolff, and others, that there still remains much for both Chemistry and Physiology to settle in connection with these two questions of "The Sources of the Fat of the Animal Body" and "The Origin of Muscular Power," yet I think we may congratulate ourselves on the re-establishment of the true faith in regard to them, so far at least as the most important practical points are concerned.

THE GERMAN ASSOCIATION

THE fifty-third congress of the Association of German Naturalists and Physicians has been held at Danzig during the past week. At the first general meeting on Saturday, September 18, Dr. H. Abegg, who filled the post of president, in a brief speech of welcome to his colleagues expressed his pleasure at finding that the congress was so numerously attended. There had been fears that Danzig, owing partly to its somewhat isolated position, would have kept many from visiting it who would otherwise have come, had the point of meeting been fixed in a more southerly part of Germany. But these fears were wholly groundless; from far and near he was rejoiced to see additions to their body; and to all and each of his esteemed colleagues he bade hearty welcome.

Herr von Ernsthausen, Prof. Bail, and the Chief Burgomaster of Danzig, also gave short addresses, in which they confirmed the sentiments of the President.

So far as the reports in the admirable *Tageblatt* go, the following are some of the principal papers and lectures:—

The first paper read was by Prof. Hermann Cohn of Breslau, "On Writing, Type, and the Increase of Shortsightedness." Myopia, *i.e.*, shortsightedness, or the inability to distinguish objects at a distance, was, as he said, rarely or never born with the subject; it is generally induced by an injurious method of study which strains the eye during childhood. In 1865 the Professor began to collect statistics such as the schools in his own native town offered to him, and from these he was able to establish the following facts:—

1. That cases of shortsightedness occur rarely in village schools; their frequency increases in proportion to the demand made upon the eye in higher schools and colleges; so that in gymnasia myopia is most prevalent.

2. That the number of shortsighted scholars in all schools and colleges increases in proportion as one examines the higher grades or classes.

3. That the average of myopia increases from class to class; *i.e.*, those who are shortsighted become more and more so.

These conclusions have since met with universal confirmation. Among the causes which tend to increase the malady, the Professor specified school-desks constructed regardless of hygienic principles, lesson-books of which the typography is cramped and indistinct, and badly and insufficiently lighted schoolrooms. All these as they now existed were more or less unsatisfactory, and could bear alteration with perceptible benefit to the scholar. Indeed to make reforms in this direction was, as he showed, the duty of the State; and he hoped that a Government commission might ere long be appointed to regulate the construction of school-desks, the typography of lesson-books, and the lighting of class-rooms. By this means the evil which was so rapidly increasing might be met, and the percentage of shortsightedness thereby reduced to a far lower minimum than was at present the case.

The next address was given by Prof. Eduard Strasburger of Jena, "On the History and the present State of the Cell Theory." Having sketched at some length the growth and the development of this theory, the learned professor remarked in conclusion:—

"The results of research into cell-structure are well adapted to teach us a great deal about the complicated nature of the fundamental substance of life; and complicated this must be, to produce such a series of phenomena in constant succession. We have merely to accustom ourselves to regard protoplasm, not as a simple substance, but, on the contrary, as a highly organised body, or we have otherwise no means of explaining the phenomena of life. It is at any rate a fact that a lump of protoplasm, the ovum, is capable, after union with another particle of protoplasm, of reproducing the entire parent organism in its complicated structure. That the properties of an egg are not essentially different from those of other protoplasm, but that rather only one part of the protoplasm in the egg is specially suited for reproduction is proved by the fact that other masses of protoplasm in the organism become often capable of reproducing it in a perfect form. The behaviour of *Begonia* leaves is specially striking; and I therefore submit a specimen of them to you. It is well known that new plants are engendered from such leaves. Microscopical investigation shows us that in these leaves there are separate epidermal cells which reproduce the whole plant; the protoplasm of a single such cell affords, therefore, the basis for an entirely new organism. Thus the process does not differ in principle from the formation of a germ from the egg.

"The attributing of all the functions of life to protoplasm is to be looked upon as a great advance in science; although it is impossible for us, so far, even to form hypotheses with regard to the forces which are at work in the protoplasm. It will be the task of the future to throw light upon this side of the question. Shall we ever be able to gain a deeper insight into the final, the invariable causes of life? At the present it were futile to attempt this. The progress which science has made in the last ten years, often yielding quite unexpected results, leads us to hope for yet further advance; and in the seeking for knowledge, rather than in its final acquisition, it is that our highest pleasure lies."

In the sectional sitting for Mathematics and Astronomy held on the following Monday, September 20, Director B. Ohlert read a paper "On the Rapid Motion of the inner Moon of Mars in the light of Laplace's Theory." He pointed out that the fact that the inner moon of Mars passes round the planet in a far shorter time than the latter needs for rotation on its own axis would seem to be in contradiction to the hypothesis of Laplace on the origin of our planetary system. The lecturer further showed that there was nothing very remarkable in the *rapidity of the motion of this moon*, which, owing to the slight distance from Mars, was wholly in agreement with the third law of Kepler; but rather that an explanation was needed of the *slow axial motion of the planet itself*, and similarly of the other planets. And hereupon Prof. Ohlert adduced proofs from which, according to his view, and in conformity with the assumption of Laplace, the rapidity of the axial motion of the planets in the final period of their formation would of necessity become diminished.

Dr. Franz then followed with a paper "On the Observation of Double-Stars made at the Konigsberg Observatory, and on certain Peculiarities of the Konigsberg heliometer."

The Section for Anthropology and Prehistoric Research held a sitting on the same day, with Dr. Stieda in the chair. Dr. Anger of Elbing exhibited a rich collection of anthropological specimens, chiefly illustrating the antiquity of the district.

In the Botanical Section Prof. Bail read a valuable paper "On Underground Fungi," in which he stated that the several species and varieties of these in Germany must certainly exceed the usually accepted number.

Prof. Moebius of Kiel, in the Section for Zoology and Comparative Anatomy, read (also on the same day) an interesting monograph "On the Importance of the Foraminifera for the Doctrine of Descent."

He began by quoting Dr. Carpenter's view that the genera and species of the Foraminifera cannot be determined after the usual method, but that the only natural classification of the great mass of different forms is to arrange them in accordance with their degree of relationship. Prof. Moebius himself had come to the conclusion from his researches among the Foraminifera which he had collected in Mauritius in 1874 that the repeatedly occurring peculiarities among the Foraminifera may serve and must serve us in forming an idea of their nature and zoological position.

The sarcode of the Foraminifera behaves with regard to the formation of the skeleton and shell just as does the protoplasm of the eggs of the Metazoa to the formation of the germs and of all organs proceeding from them. Like the protoplasm of the egg, it possesses a quite definite and hereditary capacity for self-development.

---

[1] Food in its relations to various exigencies of the animal body.—*Phil. Mag.*, July,

As confirmatory of Darwin's theory of descent, they possess a value neither greater nor less than that of all other animal classes. The lecturer's forthcoming work on the Foraminifera of Mauritius will contain much detailed evidence in support of his views.

In the discussion which followed, Herr Wacker suggested that the point of difference between Carpenter and Moebius lay in the fact that Carpenter had regard to the sarcode rather than to the skeleton, to which latter Moebius attached the greater importance.

The second paper was given by Dr. Gabriel, whose subject was "The Classification of the Gregarinæ." He objected to Stein's classification, hitherto the sole and undisputed one, on the grounds that it no longer fully represented the existing state of our knowledge. This view he was able to support, which he did at some length, and submitted to his hearers a new classification of his own.

In the Section for Anatomy and Physiology Prof. Tauber of Jena lectured upon "Two New Anæsthetics," with which he had experimented upon frogs, rabbits, and dogs. Both anæsthetics produced a scarcely appreciable change in the pulse and respiration, on which account they might be of great value for surgery. And in demonstration of their action Dr. Tauber proceeded to experiment upon a pigeon and a rabbit.

On Tuesday, September 21, at the second general sitting, Prof. Moebius of Kiel read a paper, "On the Food of Marine Animals." In the sea therefore is generated by far the greater number of animal types, and these again in quantity and in bulk are throughout regulated by the existing supply of nourishment. This in its turn depends upon the organic matter of plants, which in the sea also supply nourishment to its inhabitants. In our own seas, the North Sea and the Baltic, marine grasses are discoverable near the coast, while twenty to fifty metres lower are other kinds of plants; deeper still, if we search, we shall find few or none. Loose strips of plants that have been torn away from their roots have been brought up from a depth of some hundred metres; in the Baltic and the North Sea these form a dark, soft, spongy mass. Nothing living is visible in this if placed in a tub; but if strained through a sieve, tiny mussels, snails, and crustacea become visible. In the depths of the sea-mud lining the bottom are countless worms, mussels, and little animals which feed upon the spongy mass. Flounders and other fish penetrate into these mud-depths and devour the animals that are there. Where the sea-bottom however is formed of soft clay, nothing beyond a few worms here and there will be found. Thus in the deeper portions of the Mediterranean, otherwise so rich in animal life, nothing at all is discoverable. The Professor in the course of his remarks went on to show that the supply of nourishment to the inhabitants of the sea was now and would be hereafter undiminished; and thus that the propagation of animal life in the sea would continue unchecked, so long as the mighty ocean itself should last.

SCIENTIFIC SERIALS

Bulletin de l'Academie Royale des Sciences (*de Belgique*), No. 7.—A Hyperoodon captured on the strand at Hillion (Côtes-du-Nord, France) in December, 1879, by M. van Beneden.—On Mysticetes with short fins, from the sands in the neighbourhood of Antwerp, by the same.—On determination of albuminoid substances of the blood serum by circumpolarisation (modified method of Hoppe Seyler), by M. Fredericq.—Contribution to a study of the *rôle* of insects in the pollinisation of heterostylous flowers (*Primula elatior*), by Mr. MacLeod.

SOCIETIES AND ACADEMIES

Paris

Academy of Sciences, September 20.—M. Wurtz in the chair.—The following papers were read:—On the odours of Paris, by M. Sainte-Claire Deville. He analysed some of the moist black earth exposed in a trench in the Rue St. Jacques. The amount of salts in the impregnating liquid indicates considerable concentration (which can be easily explained). The dust from horses' shoes and from wheels of vehicles is thought to be the origin of sulphides and protoxide of iron, and of the dark coloration. The escape of gas, estimated at about a tenth of the gas circulating in the pipes, furnishes part of the sulphur, the carbonated hydrogen and the coal-tar which abounds. Through this escape the sub-soil is rendered wholesome (in the author's opinion), and cannot exhale any dangerous odour. There is a slight smell of sulphuretted hydrogen (not worse than that from sulphurous mineral waters), and a smell of healthy empyreumatic products.—M. de Tchihatchef presented a work of his on Spain, Algeria, and Tunis, but treating chiefly of Algeria. Such questions as the material and moral results of the annexation to France, the mode of action of the new administrative and social institutions, the assimilation of the Arab and the Christian elements, &c., are treated; the author has also studied the geology and botany of the country.—Observations of the new planet Coggia (287) at the Paris Observatory (equatorial of the western tower), by M. Bigourdan.—On a new experiment for showing the direction of the rotation communicated by bodies to polarised light, by M. Govi. A pure spectrum is produced with rectilinearly polarised light, and a plate of rock crystal is interposed, giving a dark band; also an analyser. The spectrum and analyser have a joint movement of rotation (one end of the spectrum being at the centre of the circle of which the spectrum represents the radius). The dark band moves along the spectrum (during rotation) one way or the other according to the nature of the quartz plate (dextrogyrous or lævogyrous). If the motion be sufficiently rapid for the impression on the eye to be continuous, one may trace out in space, or on a screen, opposite spirals. Curious variations are obtained by interposing plates of mica, gypsum, &c.—Study of telluric lines of the solar spectrum (Nice Observatory), by M. Thollon. With his powerful spectroscope, he has resolved the telluric groups B, D, and a of Ångström into their simple elements, separating these elements from each other, and from the other metallic lines.—On the liquefaction of ozone and on its colour in the gaseous state, by MM. Hautefeuille and Chappuis. They passed some highly ozonised oxygen (prepared by their new process) into a Cailletet apparatus. From the first strokes of the piston the capillary tube appeared azure blue. With several atmospheres' pressure the gas became of an indigo blue, the mercury meniscus looking steel blue through it. Sudden liberation from 75 atm. produced a mist, indicating liquefaction (300 atm. were necessary in the case of oxygen). Ozone is a little less easy to liquefy than carbonic acid. If the ozonised oxygen be not compressed slowly and in cold, the ozone is decomposed, giving a strong detonation and a yellowish flash. Thus the mixture contains an explosive gas.—On Brunton's tunnelling machine, by M. Biver. This gives an account of results with the machine as used in the lignite pits in the Fuveau Valley. It appears, *inter alia*, that of 51 horse-power of the motor only 12·4 was transmitted to the machine, 38·6 being lost.—Telescope with double action for pointing long-range guns, by M. de Broca.—On losses in manufacture of vinegar, by M. Garcin.

THE PLACE OF SCIENCE IN EDUCATION

THERE has been a great deal said and written on the subject of education during the past week. First of all we have the important address of Prof. Huxley at the opening of the Mason College, Birmingham, which we give in full on another page; then there is the brief but significant address of Sir Stafford Northcote at Tiverton; and lastly, the summary of Sir Charles Reed of the ten years' work of the London School Board. All this has furnished ample food for comment in the daily papers, and their misconceptions as to the real drift of Prof. Huxley's address must be amusing to those who know what science really means, and what are the opinions held by reputable men of science as to what constitutes sound and complete education. With regard to the institution which has been so generously founded and handsomely endowed by Sir Josiah Mason at Birmingham, it should be remembered that there was no intention to start it as a university. Its founder has had to push his way through life, and notwithstanding the unusual success of his career, he confesses that he has but little faith in the rule-of-thumb method, which was often his only guide. At every step, he admits, he was hampered and hindered by the want of scientific knowledge, by his ignorance of those exact methods, those laws and facts, which can only be satisfactorily acquired and utilised by a preliminary scientific training. Even at his advanced age the consciousness of this want is so strongly impressed upon him that, with true benevolence and rare generosity, he has founded the magnificent institution at Birmingham which was opened last Friday, in order that succeeding generations of boys may have a chance of equipping themselves at the outset with those weapons of precision, the want of which he who has fought successfully the battle of life had to deplore at every step. The Mason College at Birmingham is not a mere technical institute, as may be seen from our article in NATURE, vol. xxii. p. 514, in which the course of instruction provided is described. All departments of science are provided for, as well as certain special applications of some of them; the great principles and facts of these sciences first, and their special application afterwards. Wisely also the founder has provided for instruction in the English, French, and German languages; and even, as Prof. Max Muller stated in his brief but admirable address at the luncheon, for Greek and Latin. The deed of foundation makes ample provision for the widening of the programme, the extension of the subjects taught, and the adaptation of the institution to the times. Special reference is made to art, which will no doubt be added. At the same time the founder excludes from his programme "mere literary education." It is, we suppose, this exception—which looking at the programme of the College, seems to us somewhat vague—that has led the daily press to misconceive Prof. Huxley's address as a defence of science as a means of education, to the entire exclusion of literature. What Prof. Huxley maintains, as we read his address, and as we read his other utterances on the same point, is, that if a man is to have an education in only one aspect of things, then by all means let it be the scientific aspect; on the other side he can educate himself at his leisure, whereas, as Sir Josiah Mason forcibly testifies, when a man gets into the thick of the fight, it is all but impossible for him to make up for the want of scientific training in his youth. As a mental discipline and a means of culture science by itself is as good an implement as literature by itself, and probably a great deal better, as the former takes us into the very heart of nature in its widest sense, while the latter only deals with the outside of things. At the same time Prof. Huxley expressly states that exclusive training in either the one direction or the other is essentially lop-sided, and not to be encouraged; that it is essential to the completeness of a man's culture that it should have an æsthetic and literary, as well as a scientific side; and what other opinion could be held by one who himself seems familiar with "the best that has been said and thought" in all the languages of culture. We are much mistaken if Prof. Huxley would not endorse every word spoken by Prof. Max Muller, on the necessity for the study of the science of man, the science of thinking and of speaking, to a completely liberal education. The truth is that there is a widespread misconception as to what science really means; we have been so long accustomed to apply the term to certain groups of concrete facts, that we forget that it may be applied, and indeed is now frequently applied, to any branch of knowledge investigated on the method which has been so fruitful in the study of physical phenomena. Science indeed is merely the counterpart of sentiment; each of them has its proper place, and each of them is indispensable to the complete development of the human mind. To neglect training on either the one side or the other must produce an imperfect, a lop-sided result; but there is no reason why either should be neglected. Let the programme of elementary education only be developed in the direction so long advocated by Sir John Lubbock and those who think with him, and let the whole of the education of the country up to our colleges and universities be carried out on the same lines, and every side of the human constitution and every aspect of human learning will have fair play. Prof. Huxley did well to defend science as a method of mental discipline certainly equal to the old and merely literary methods which so long prevailed at our universities, and which have been so abused; but his address will be strangely misread if any idea of suppressing the old learning is attributed to him. It is interesting to notice that Sir Stafford Northcote, in his short address at Tiverton, followed the plan of that of Prof. Huxley, beginning by strenuously advocating the spread of scientific education in the country as the only means by which we can be able to cope with our neighbours, and concluding by maintaining that it would be a serious mistake to suppress literary training entirely. This is what we have all along maintained in these pages, and we are sure that Prof. Huxley is on our side. Science has had a hard fight to obtain a place in the education of the country, and she has not yet obtained the place she is entitled to; she will only have done so when in all our educational institutions she holds a position of perfect equality alongside of the subjects which until recently monopolised our schools and colleges, and we trust that when another decade's work of the London or any other School Board has to be summarised, the so-called extra subjects will have become an integral part of the elementary education of the country. Such institutions as that opened at Birmingham will greatly help on the cause of scientific education. The standard of teaching we are glad to see is high, the best science schools of the Continent being taken as models; and we trust the Mason College will never degenerate into a mere technical training-school. Under the liberal principles for its conduct laid down by the founder, it is capable of the widest development in every direction; whether it may form the nucleus of a Birmingham University remains to be seen. Its working will be watched with the greatest interest by all who have at heart the raising of the standard of education in the country.

CHEMISTRY OF THE CARBON COMPOUNDS

Elements of Chemistry. By William Allen Miller, M.D., &c. Revised and in great part re-written by Henry E. Armstrong, Ph.D., F.R.S., and Charles E. Groves, F.C.S. Part III.—Chemistry of Carbon Compounds, or Organic Chemistry. Section I.—Hydrocarbons, Alcohols, Ethers, Aldehydes, and Paraffinoid Acids. Fifth edition. (London: Longmans, Green and Co., 1880.)

THE study of the laws governing the combinations of molecules containing carbon is of the very first importance to chemical science, inasmuch as this study so well illustrates and extends the general laws of molecular combinations, that is to say, the general laws of the science of chemistry.

An almost innumerable array of facts concerning carbon compounds is to be found in the ordinary text-books; papers in the chemical journals sometimes contain generalisations drawn from certain classes of those facts: the later supplements to Watts's "Dictionary" contain the more important of the comparatively recent generalisations; but there has undoubtedly existed for some time among students of chemistry a wish for a text-book in which the leading facts concerning the compounds of carbon should be clearly stated, the general properties of, and general relation between groups of these bodies should be indicated, and summaries of the evidence in favour of or against the generally adopted structural formulæ of the more important compounds should be presented to the student, in order that he might thus have in one text-book such a fair compendium of the present state of this branch of the science as should furnish him with suggestions for work, by showing him what is clearly known, where exact knowledge ceases, and where even analogy lends but little help.

The first part of such a text-book English chemistry now possesses; let us hope that the second part of this admirable book will soon follow, and be worthy of that now published.

In their preface the editors—had we not better say at once the authors?—write:—"Notwithstanding the extraordinary increase in the number of the carbon compounds, their study is gradually becoming simplified as the possibility is extended of arranging them in series and of giving a general description of their chief properties applicable to all the members of the group."

There can be no hesitation in saying that the authors' work—more than any other text-book in the English language—will aid the advance of this, the only true method, of studying Organic Chemistry.

There are text-books of Organic Chemistry which tell the student that the structure of this or that compound "is represented by the following formula"; this book follows another and a better plan: the authors give a succinct and clear sketch of the evidence for and against all important structural formulæ, thus indicating the true value of these formulæ as condensed statements of chemical facts, and at the same time setting before the student examples of the application of the chemical method of inquiry.

The general principles underlying the formation of so-called structural formulæ are adverted to in more than one place by the authors.

These formulæ are based on the laws of "atom-linking," which again are deductions from the theory of quantivalence or valency, itself an outcome of the application of chemical methods of inquiry to the molecular theory of matter.

Although the volume before us is Part III. of a large work, the first part of which deals with chemical physics, it would nevertheless, we think, have been advisable to have given a brief sketch of the molecular theory of matter, and to have shortly stated—but more fully than is done on p. 42—the evidence on which is based the (chemically) all-essential difference between atom and molecule.

A little space might have been spared for an exposition of the laws of atom-linking, such as, but very much more condensed than, that in Lothar Meyer's "Modernen Theorieen."

In speaking of quantivalence, on p. 42, the authors do not explicitly state that it is the *atoms* of the elements which "are equivalent in combining or replacing power to one, two, three, four, five, or six monad atoms of hydrogen." Of course this is implied throughout the discussion which follows, but students sometimes fail clearly to grasp the difference between the old chemistry, which attempted, but failed, to determine equivalent weights of elements, and the new, which is so largely based on the equivalency of groups of atoms of the elements.

Frankland's "bond" explanation of valency is sketched, but so long as we have no definite physical conception of what a "bond" is, this explanation really explains nothing; such an expression as "two of the bonds neutralise each other" has no meaning, further than that the valency varies from a given number to two less than this number.

The authors give some examples of compounds, which seem to show that the valency of certain elementary atoms may vary from an odd to an even number; but they do not give examples which prove such a variation, *e.g.*, $MoCl_5$ and $MoCl_6$; WCl_5 and WCl_6; NO, NO_2, and NH_3.

The authors, probably wisely, do not very definitely express their opinion as to the exact meaning of a structural formula; they sometimes appear to regard these formulæ as real representations of the relative mode of arrangement of atoms in a molecule, sometimes only as condensed statements of facts of formation and decomposition. If the former view be adopted it becomes a question whether the "structure" represented by the formula is that of the molecule when unacted upon by the molecules of foreign bodies, or only when a certain disposition of its parts has been induced by the action of the molecules of another substance.

Facts are certainly known which are best explained by supposing that a change of some kind precedes that process of complete molecular decomposition usually called a chemical reaction; indeed almost the only feasible hypothesis of chemical action supposes that chemical change—that is, change among the parts of the molecule—may be proceeding without a permanent molecular decomposition taking place. In the section on "Aldehydrols" the authors apparently admit some such hypothesis as this; they do not regard the non-isolation of a compound as proof of the non-existence of that compound; they explain processes of chemical change by supposing the existence of unstable molecular configurations intermediate between more stable and isolable configurations.

Recent work in chemical physics appears to lend some countenance to the idea that structural formulæ may roughly represent the configuration of molecules just previous to their passage into phases of "absolute instability" rather than their configuration when in phases which are themselves "absolutely stable."

Quite recently a distinct advance has been made in molecular theories by the recognition of what might be called *atomic induction*, that is, the influence exerted by one part of a molecule in modifying the chemical function of another part, or other parts, of the same molecule. Illustrations of this "orientation" are to be found in the production of the substituted derivatives of benzene and of the phenols; the generalisations made in these cases are clearly stated by the authors.

A very valuable section on the Van't Hof Le-Bel hypothesis of isomerism is to be found from pp. 983 to 993. (There is evidently an omission of part of a sentence at the top of p. 993.) The authors suggest a slightly modified form of this hypothesis. The fundamental assumption is made in these hypotheses that chemical energy is entirely potential, and that it is wholly due to the arrangement of the parts of the molecules. It seems possible however that chemical energy may be partly potential and partly kinetic, and that if any means could be found for measuring the change of entropy as well as the change of total intrinsic energy of chemical systems in their passage from one standard state to another, some light might be thrown on the question of isomerism.

In their general classification of carbon compounds the authors have adopted a scheme founded on the chemical function of these compounds; they group together hydrocarbons, alcohols, aldehydes, &c. They do not fail to indicate how function is associated with "structure." But in each of these great groups of compounds a classification founded more upon genetic relations is adopted; they consider a group of hydrocarbons, then the haloid derivatives of these hydrocarbons, and so on.

Most admirable tables are appended to all the more important groups; the usefulness of these tables may be illustrated by reference to that on pp. 458-459, wherein the ethylic alcohols are arranged in *really* homologous series.

The acids are classified into various sub-groups, and the dependence of the function of the "acid hydrogen" on the "structure" of the other part of the molecule is indicated.

In speaking of the higher aromatic or "benzenoid" hydrocarbons, the happy expression is used of a closed chain containing "*loops*," and it is pointed out that "the formation of each new loop in the chain of carbon atoms tends to reduce the combining power by two units."

The proof (p. 399) that the carbon atoms in the olefines are not arranged in a closed chain is noteworthy, and may be taken as typical of the authors' method of dealing with such questions; basing a generalisation on carefully collected facts, and then applying their generalisation boldly, but without dogmatism.

The nomenclature of the work before us is much more self-consistent than that adopted in any other treatise on organic chemistry. Certain new names are introduced: thus, the bodies supposed to exist in aqueous solutions of many aldehydes—substances characterised by the groups $CH(OH)_2$—are called *aldehydrols*. A systematic nomenclature for the carbohydrates is proposed: those of the composition $C_6H_{12}O_6$ have names ending in *ose*, glucose being the best known example of this class; those of the composition $C_{12}H_{22}O_{11}$, which like cane-sugar produce two molecules of glucose on inversion, have names ending in *on*, *e.g.*, saccharon; and those which on hydration give rise to the formation of a saccharon have names ending in *yn*, *e.g.*, amylin. As another instance of the authors' attempt to systematise nomenclature may be noted their rules for the use of the Greek letters α, β, &c., in distinguishing isomeric derivatives (pp. 861-2, *note*).

Finally, I would draw attention to the authors' manner of dealing with physical methods of solving chemical problems: the physical method is so described that one cannot forget that it is to be used by a chemist—there is not first a little physics, and then a little chemistry; the problem is clearly chemical, the method only is physical.

A suggestion made in the preface seems most admirable, it is that "Each chemical school" would do well to "make the preparation by its students of certain substances in a state of purity a part of the ordinary course of study, and to give notice that these particular compounds are at the disposal of experts for the determination of physical constants."

Is there any probability of a treatise being written on Inorganic Chemistry conceived in the same spirit and carried out, as far as possible, on general lines similar to those of this most excellent work by Armstrong and Groves?

M. M. PATTISON MUIR

OUR BOOK SHELF

An Elementary Treatise on Solid Geometry. By W. Steadman Aldis, M.A. (Cambridge: Deighton, Bell, and Co., 1880.)

THE term "elementary" diagnoses this handy book to solid geometry from the more thorough works on the same subject by Messrs. Salmon and Frost. It is, to our mind, exceedingly well adapted to the requirements of that large class of students who, whilst requiring an acquaintance with this branch of study, are unable, either through want of time or the requisite ability, to extend their reading into the more recondite parts discussed by the above-named writers. As a proof that Mr. Aldis's labours have been appreciated, we need only say that this edition, improved by the addition of hints for the solution of some of the examples, is the third.

Familiar Wild Flowers: Figured and described by F. Edward Hulme. 2nd Series. With Coloured Plates. (London: Cassell, Petter, Galpin, and Co.)

WE have already called attention to the appearance of the first volume of this series, and of the second we can speak in equally favourable terms. In selecting for illustration a hundred of our familiar wild flowers, all chosen in some way for their beauty, a certain amount of arbitrariness must be allowed; but in the present instance very little complaint will be made on this head by the majority of readers. The coloured lithographs are somewhat unequal in excellence, but, as a rule, are extremely good. The book is one well adapted to awaken or to foster in young people a love of the floral beauties of our fields and hedges, woods and ditches.

A New and Easy Method of Studying British Wild Flowers by Natural Analysis. By Frederick A. Messer. (London: D. Bogue, 1880.)

THIS work indicates a very large amount of labour on the part of the author; whether the labour has been altogether well applied is another question. For the field botanist whose sole object is to determine the name of a wild flower it will no doubt be useful in assisting him to make out at least the order and genus, for beyond this it does not pretend to go. No botanist will be disposed to depreciate the value of field botany and of the study of critical species, which often leads to further study of some of the great questions connected with the life of plants. There is no doubt that species-botany had been exalted a quarter of a century ago to a far too prominent place by English workers, and had been much too exclusively followed, to the disregard of morphological and especially of physiological work. The inevitable reaction has set in, and is now perhaps at its height, when the number of botanists who have an accurate acquaintance with our British flora is extremely small. As an introductory work for those who are desirous of increasing this number, Mr. Messer's book may be recommended, always provided that the student does not imagine that it will materially help him in his study of the structural and genetic affinities of the different families of plants. The graphic illustrations are novel in design, and will no doubt help to impress the meaning of the technical terms on the beginner. Some few errors should not have been allowed to pass in a work bearing the date of the present year. Among these is the reference of *Selaginella selaginoides* to the genus *Lycopodium*, and the complete suppression of Selaginellaceæ as a British order of vascular cryptogams.

Manual of the Indigenous Grasses of New Zealand. By John Buchanan, F.L.S. (Wellington: James Hughes, 1880.)

THIS is one of those excellent manuals emanating from the Colonial Museum and Geological Survey Department of New Zealand under the admirable direction of Dr. Hector. The work is a reproduction in a handy form of the folio work ordered by the New Zealand Government in 1876, to be prepared "with nature-printed plates and descriptions of each species, and to be accompanied by an essay on the grasses and forage plants likely to prove useful in New Zealand." This explanation is extracted from the preface of the book before us, which preface has been written by Dr. Hector himself. We also learn from the same source that "the whole of the illustrations of the large edition were drawn from nature by Mr. John Buchanan. . . . The condition imposed—that the plates should be nature printed—rendered it necessary in the first instance to publish the work in folio, but, as this large size is both inconvenient and costly, only a small edition has been issued, and the present handy volume has been printed for more general distribution. The plates now given—sixty-four in number, and including eighty-seven different species and varieties of grasses—are reductions by the process of photo-lithography from the original folio plates, and depict the grasses as of one half the natural size of the original specimens."

There can be no doubt but that the book will be very valuable, not only to the botanist, but also to those who wish to know all about New Zealand grasses for their utility for fodder or for other purposes. The plan adopted in the book is to give under each genus a brief generic description and general distribution over the world, the names of the countries being given in capitals, so that they catch the eye at once; this is followed by the etymology of the generic name. The species are then separately enumerated, the generic and specific names standing first, followed by the common name, reference to the plate, synonyms, habit of the plant, time of flowering, specific description and distribution of the particular species, after which is a good account of the properties and uses of the grass, and a detailed reference to the figures. The book is extremely well printed, the plates are well done, and there are two capital indices, the first to genera and species, and the second to popular names. JOHN R. JACKSON

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*]

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

Geological Climates

IN NATURE, vol. xxii. p. 200 *et seq.*, there occurs an important statement by Mr. J. Starkie Gardner, to the effect that fossil remains not distinguishable from *Araucaria Cunninghami* had been found among the Eocene plant beds of Bournemouth, in the south of England.

After reading Mr. Gardner's paper, I availed myself of an opportunity of studying the leaflets of the living and dead specimens of this species of *Araucaria* in the Kew Gardens, including the original specimens in the Herbarium named by Mr. Cunningham, and agree with Mr. Gardner as to the difficulty of separating the *A. Cunninghami* from the Sequoias by leaflets alone when in the fossil condition.

Assuming Mr. Gardner's conclusion to be true, viz., that the Eocene Bournemouth tree was identical, or nearly so, with the living *A. Cunninghami*, a question arises as to climate which will prove insoluble to geologists of the school of Lyell and his followers, who assume that all physical causes during geological time have been pretty much the same as at the present time and times immediately preceding the present.

The Moreton Bay Pine (*A. Cunninghami*) is found, as the name imports, on the shores of Moreton Bay, on the east coast of Australia, and has a range of 900 miles, from 14° S. lat. to 29° 30′ S. lat. along that coast. It does not extend more than eighty miles inland, where, instead of being 130 feet in height, which it is on the coast, it becomes a dwarf tree, and farther inland it entirely disappears.

This tree therefore becomes a most delicate self-registering thermometer, indicating to us precisely (after the well-known manner of plants) the exact conditions of the Eocene climate that existed in Bournemouth during the earlier Tertiary period. I propose to examine the evidence given by this thermometer, and to invite my *uniformitarian* friends to explain how this evidence can exist in conformity with their views.

The climate of the northern limit of the Moreton Bay Pine is as follows (as regards heat):—

Mean (January).	Mean (July)	Mean (Annual).
82°·0 F.	71°·0 F.	76°·5 F.

The climate of the southern limit is—

Mean (January).	Mean (July).	Mean (Annual).
72°·5 F.	57°·5 F.	65°·0 F.

The mean of both being—

Mean (January).	Mean (July).	Mean (Annual).
77°·25 F.	64°·25 F.	70°·75 F.

The present mean annual temperature of Bournemouth is only 50°·4 F., which is 20°·35 F. below its mean annual temperature in the Eocene period.

I want to know how Lyell and his followers propose to give to Bournemouth, from present existing forces and causes, this additional 20° F. of heat. If geologists really wish to earn the respect of their fellow-workers in more exact branches of knowledge, they must condescend to consider *quantitative* as well as *qualitative* questions, and enter into numerical details. To enable them to do so I lay down the two following statements:—

1. Of all places now existing on the same parallel of latitude as Bournemouth the highest mean temperature is in 20° W. long. (in the Atlantic), where the temperature is 53°·1 F., or only 2°·7 F. above that of Bournemouth.

Of all places on the same parallel the lowest mean temperature is found at 80° W. long. (on the borders of Labrador and Canada), where it is 29°·3 F., which is 21°·1 F. below that of Bournemouth, and 2°·7 F. below the freezing point of water.

Existing forces and circumstances might therefore benefit Bournemouth to the extent of 2°·7 F. degrees, or might injure it to the extent of 21°·1 F.; but how is Bournemouth to gain the 20° of heat necessary for the flourishing of the *Araucaria Cunninghami* on its Eocene sea-shore swamps, if existing causes only were at work?

2. The place in the northern hemisphere which is now most closely allied in climate to Moreton Bay, or to Bournemouth in Eocene times, is the central part of the Gulf of California, in Western Sub-tropical America.

Again, I ask geologists of the *uniformitarian* school to show me how they propose to convert the climate of Bournemouth into the present climate of the Gulf of California or that of Moreton Bay by mere transposition of land and water, without shifting the position of the earth's axis, which is an inadmissible hypothesis?

Trinity College, Dublin, SAML. HAUGHTON

The Naini Tal Landslip

FOR the purpose of making a thorough inquiry into the details of the causes that led to the above lamentable disaster an able geologist would undoubtedly be required, as was suggested in your leader last week. I think, however, that to any one who, like myself, has resided even but temporarily at Naini Tal, the main cause of the recent slip must be sufficiently obvious without the aid of the geologist.

From the account of the particular buildings overwhelmed it is plain that the slip took place close to where an almost equally bad one occurred some years ago (in the winter of 1865, I believe), viz., just above the Victoria Hotel, on the shoulder uniting the two peaks of Cheena and Lyria Kauta.

The foot of this shoulder forms the northern border of the Tal, or lake, for which the station is justly famed; the strata composing it, as far as I can remember, dip *with* the slope of the hill southwards towards the lake. Moreover, it faces the direction from which the rain mostly comes. The conditions for the production of a landslip in the direction of the lake are thus amply fulfilled.

Though landslips are not at all infrequent from this hill (one occurred near Cheena when I was there, killing two natives), it is from its sunny aspect and *comparatively* gentle slope decidedly the favourite, the station being mainly built on its slopes or at its foot.

On the hill which forms the southern border of the lake the dip of the strata is in the opposite direction to the slope of the hill. It is consequently much freer from landslips, and much safer than the former, as only a few chips at most could be detached from it on the side facing the lake, by the action of rain. The nearly constant gloom however in which, from its northern aspect and its steepness combined, it is necessarily shrouded, as well as the lack of building area, naturally tends to limit its population. This hill again on its *southern* side, which faces the plains, repeats the same phenomena as the shoulder before mentioned; an enormous portion of it having become detached towards the plains, and called pre-eminently "*The* Landslip."

When staying in the Victoria Hotel in May and June, 1877, I always felt it would take very little to bring the whole hill, and especially Government House, which appeared almost vertically above us, down on top of us. The old landslip which I mentioned as being close to the present hotel buried its predecessor, and might be thought to have furnished ample warning against choosing such a dangerous spot upon to which to rear a fresh one.

To guard against such disasters in future I would suggest that all houses in the hill-stations should, if possible, be built mainly where the strata dip in the opposite direction to the slope of the hill, and that where the strata dip in the same direction as the slope of the hill all proximity to steep slopes should be avoided, and only the gentler slopes utilised for building on.

I may add that the rainfall on the present occasion seems to have been phenomenal, if, as the *Times* says, it was thirty-three inches in seventy-two hours. Still, extraordinary and sudden downpours of this kind must be expected, where the summer rainfall has varied from forty inches in 1877 to 117 inches in 1862. E. DOUGLAS ARCHIBALD

Tunbridge Wells, October 2

Branch-cutting Beetles

IT is rather curious that the story which Mr. Ober was told in the Carribbees (NATURE, vol. xxii. p. 216) should be generally believed in Southern Brazil also, viz., that a large beetle "seizes a small branch of a tree between its enormously long nippers, and buzzes round and round the branch till this is cut off." Only in the Antilles this cutting of branches is attributed to a huge Lamellicorn, the *Dynastes hercules*, and in Santa Catharina to a large Longicorn, the *Macrodontia cervicornis*.

Everybody here will tell you this story, but nobody, as far as I know, has ever seen the beetle at work. Branches *are* often cut off by some animal. On a camphor-tree in my garden six branches, from 9·5 to 13·5 centim. in circumference, have been cut off; and on a *Pithecolobium* for some time almost every morning a fresh branch had fallen down, some being even much thicker than those of the camphor-tree. The cutting is always in a plane perpendicular to the axis of the branch, as it would be were it made by a rotating beetle; but in this case an annular incision of equal depth all round the branch would be produced, and this I have never seen. On the contrary, the incision, which causes the branch to break off, consists of two parts, occupying the lower and the upper face of the branch, meeting on one or on either side of it, and being separated by a wedge-shaped interval, which is broken by the weight of the branch, and is narrower or broader according to its toughness.

Once—many years ago—I came to the *Pithecolobium* tree early in the morning, when a branch was just falling down, and with it came down the animal by which it had been amputated. It was a Longicorn beetle, the well-named *Oncideres amputator*, Fabr. I have since seen specimens of some other species of the same genus, which had been caught by others in the act of cutting branches. It is almost unnecessary to add that they do so by gnawing, and not by whirling round the branches.

The Tay Bridge Storm

IN NATURE, vol. xxi. p. 468, Mr. Ley asks, relative to my letter on the Tay Bridge storm, which appeared in NATURE, vol. xxi. p. 443, on what evidence I state "that when the velocity of the cyclone centre is very great, the strength of the wind for any gradients is increased, or at all events becomes more squally and gusty."

I much regret the circumstances which have prevented my replying to him sooner, but may now state shortly the three principal pieces of evidence which led me to that conclusion:—

1. My own observation in a large number of cyclones where the velocity of translation was very great, there has been a quality of gustiness or squalliness and intensity generally greater than is usual for the observed gradients.

2. Ever since the barometer was invented it has been known that a rapid fall of the mercury indicates worse weather than a slow one. Now we know that the rate at which this fall takes place at any station depends:—(1) On the steepness of the

gradients. (2) On the nearness of the observer to the path of the cyclone centre. (3) On the velocity of translation of that centre.

In a great many cases I have observed, especially in the west of Ireland, that when a rapid fall of the barometer is reported, the wind is much stronger than existing gradients would seem to justify.

From this it would seem than the rate at which the change of pressures is taking place has some influence on the strength of the wind.

3. Prof. Loomis has shown in his examination of the U.S. Weather Charts that in American cyclones the area of rain-cloud extends further in front when these storms are going fast than when they are going slow.

From this it would appear that another element of intensity besides wind, viz., precipitation, is increased when a cyclone centre moves with great rapidity.

It was mainly on these grounds that I based the statement in my former letter. RALPH ABERCROMBY

Deltocyathus Italicus, Ed. and H.

I FIND that Prof. Ralph Tate, F.G.S., President of the Adelaide Philosophical Society, has lately written as follows in an anniversary address. "On the other hand the Geelong coral, *Deltocyathus italicus*, Ed. and H., better known from the Italian Miocenes, is considered by Count Pourtales and Sir Wyville Thomson to be specifically distinct from its living analogue inhabiting the deep waters of Florida—an opposite opinion to that held by Prof. Duncan." During the last conversation I had with the late M. de Pourtales he informed me that after having seen and studied the Italian types, he was satisfied that I was correct in the statement I had made regarding the specific identity of the Tertiary and recent forms.

Temperature of the Breath

MY attention has been directed to a communication under the above heading by R. E. Dudgeon, in NATURE, vol. xxii. p. 241. The speculations therein raised regarding the temperature of the breath are scarcely compatible with ascertained physiological truth. Mr. Dudgeon's friend's explanation, against which he argues, is undoubtedly correct. The great value of woollen clothing in preventing chill after exercise may be explained on the same principles. The hygroscopic state of the atmosphere (and material) is the condition which causes variation in different experiments. Different materials have effects corresponding to their hygroscopic properties. The following results of a few experiments which I recently made speak for themselves:—

No. 1.—Temp. of air, 87° F.—Air moderately dry (dew point not ascertained).
,, breath, 96° in mouth cavity.
,, ,, 102°·9.—Thermometer enveloped in four folds wool.
,, ,, 102°·2.—Thermometer enveloped in four folds silk.
,, ,, 100°·8.—Thermometer enveloped in four folds linen.
No. 2.—Temp. of air, 79° F.—Air very damp, raining heavily.
,, breath, 97° in mouth cavity.
,, ,, 99° ,, through four folds of silk.

Time occupied in each observation, three minutes.

Madras, September 9 C. J. MCNALLY

Swiss Châlets

I DO not know whether the idea has previously occurred to any one that the modern Swiss châlet is a descendant of the old lake dwelling, but I was strongly impressed with that conviction this autumn. Not only do they actually build the smaller châlets, used as storehouses, entirely on short piles, but very many of the dwelling-houses are still one half on piles, the steps leading up to the gallery passing through a hole in the middle, so that the modern exterior gallery would represent the original platform. In the lake dwelling the probability is (I would suggest) that there was a trap-door in the centre of the platform, inside the inhabited part, with a movable ladder, so that the latter could be drawn up and the trap-door closed if required. At the present day the ladder is represented by fixed wooden or stone steps leading up into the gallery. The house being now on land, the lower part is half or entirely closed in, and so forms an extra chamber, though the family still dwell above the platform (*i.e.* the gallery) as in days of yore. GEORGE HENSLOW

Fascination

FASCINATION originally meant a supposed power in man and snakes of controlling or arresting the movements of various animals by a glance. Your correspondent M. Chatel's personal anecdote, with his comment thereon, suggests that the snake in some way mesmerises his victim, not by its glance but by its movements. His supposition that "the rapid gyratory motion of a shining object" leads on to the debilitating nervous attack, is open to debate. In displays of fireworks such motion occurs before crowds without making any one sick or frightened or inclined to rush into the middle of a catharine-wheel. However then the motions of the snake, whether swift or slow, may avail in attracting and fixing attention, the final catastrophe is probably due to pure fright, according to the old saying, *Multis ipsum metuisse nocet.* We may safely infer that your correspondent himself would have felt no squeezing round his temples had he known at first that the snake was for him a harmless one, and not a viper nearly five feet long!

In the opening letter on this subject the basilisk and the bombshell seemed to be endowed alike with a semi-miraculous power of enchaining the victims that looked upon them. Now, that small birds should be paralysed with terror at the sight of a gesticulating snake is possible or probable enough; but that English officers should be rooted to the ground by mere alarm at the flight of shot or shell is an uncongenial explanation of facts which appear to me capable of interpretation on a different hypothesis.

In moral, as distinct from physical, perils, there is good reason to suppose that too close a concentration of thought upon a danger has a tendency to overpower the will and bend it to the commission of the very acts which the intellect has pronounced unchoiceworthy. But the acts so committed carry with them present gratification. To use the common simile, men fly to them as moths to a candle, not because they are panic-stricken, but because the sense of the danger is lost in the pleasure that attends it.

I am inclined, in the present state of the controversy, to group the effects of so-called fascination under three heads: (1) there is the effect of paralysing terror; (2) there is the effect of indecision; (3) there is the effect of qualities attractive and repulsive accidentally combined in the same object. The first and second effects are perhaps at times combined together in various degrees, and mixed with that absorbing curiosity of which Mr. Hodgson speaks (NATURE, vol. xxii. p. 383), but which by itself seems rather to deserve the name of abstraction than of fascination.

As to fascination in the original sense of the word, its nature may await discussion till observation proves that such a power in reality exists. THOMAS R. R. STEBBING

Tunbridge Wells, September 27

Air-Bladder of Herring

IN NATURE, vol. xxii. p. 520, there was an abstract of Mr. F. W. Bennett's paper on the "Visceral Anatomy of the Herring" (*Journ. Anat. and Phys.*, July 1880). It has escaped the notice of Mr. Bennett that Dr. E. H. Weber described and figured (Tab. vii. 63) the posterior opening of the air-bladder of *C. harengus* into the urogenital sinus in his "De Aure et Auditu Hominis et Animalium," pars i. 1820.

Zoological Museum, Cambridge ALFRED C. HADDON

The "Waiting Carriage"

M. HANREZ' proposed "waiting carriage" (NATURE, xxii. 519) has doubtless been schemed by many readers before now. A simpler form had long ago occurred to me, having the drum of cable in the *train* engine, the cable passing under the carriages and catching the waiting carriage at the tail. The running out of rope could be as well managed at one end of the train as at the other, and only an ordinary carriage without any special engine would be required, which would be dropped just before picking up another at the next station, each carriage thus slowly shifting round the line.

But any such plan would entail a fresh build of carriages; and for discontinuous carriages a plan nearly as good would be to run a railway omnibus on the rails, with a small 6 or 8 h.p. engine all in one. This would be stopped anywhere between stations, at crossings, farmhouses, and hamlets along the line, and would serve the peasantry for going shopping, beside taking up baskets of garden produce. Passengers going a long journey would change at a main station and join the ordinary train, which would only stop about every hour at the ends of forty or fifty miles' stages. Country lines only running a train every two hours or so would be easily worked thus, the 'bus being shunted by telegraph if necessary, and the line signalled clear as usual. With double lines the 'bus would run on the goods line.

Bromley, Kent W. M. F. PETRIE

A NEW KIND OF ELECTRIC REPULSION[1]

DR. GOLDSTEIN has devoted a good part of the last ten years to an investigation of the discharge of electricity through gases, and amongst the many phenomena which he has brought to light, the one described in a memoir published in a separate form is not the least interesting and important. The facts may be stated in a few words: *A negative electrode exerts a strong repulsion on the rays of the glow proceeding from itself or from another negative electrode.* Before describing the experiments proving this statement, and the laws by which this phenomenon is regulated, we shall follow Dr. Goldstein in reminding the reader of a few facts connected with a discharge of electricity through gases which he will have to bear in mind.

It is well known that the negative electrode in a gas, for which Faraday's name of cathode may be conveniently used, is surrounded with a glow which expands as the pressure of the gas is reduced. We are able to distinguish four layers in this gas, though three of them only are easily recognised. As a first approximation we may assume the outline of these layers to be parallel to the outline of the electrode, though, as we shall have to mention, Dr. Goldstein has shown that this is not strictly correct.

The layer of the negative glow adjacent to the cathode is luminous, and shines in air with a yellowish-red tint. This first layer is surrounded by a second layer, which is very little luminous. This is the dark space mentioned by Mr. Crookes; but, as Dr. Goldstein shows, it is not entirely dark, but has in air a bluish tint. We next come to the third and fourth layers, which may very well be taken as one, and which are more generally designated by means of the term, negative glow. They form the outer boundary of the luminosity surrounding the cathode. If the pressure of the gas is sufficiently reduced to enable the glow to touch the glass, it becomes phosphorescent, and only the layer of the gas immediately touching the glass causes the phosphorescence. The phosphorescence gets stronger as exhaustion proceeds; at the same time the luminosity of the glow gets weaker. The appearance and extension of the glow does not depend on the position of the anode, while the luminous positive discharge varies very much with the relative position of the electrodes, and can be made to disappear altogether by bringing the electrodes sufficiently near.

Already Plucker, and especially Hittorf, have come to the conclusion that the negative glow is propagated in rectilinear rays from the cathode, and it can further be shown that the direction of propagation is generally in a direction nearly normal to the surface of the cathode. Dr. Goldstein draws a distinction between such elements of the cathode which lie near the edge, if the surface of the cathode has edges, and elements which are removed from the edge. While those elements not near an edge only send out rays within a cone of narrow aperture in a normal direction, the edges send out rays in all directions. This difference in the behaviour of different elements of the same surface is, it appears to us, well explained by Dr. Goldstein's discovery of a repulsion between the electrode and a ray proceeding from the cathode. A little consideration will show that this repulsion will, whenever cylindrical or plane electrodes are used, be in a nearly normal direction for any part of the surface which is sufficiently removed from the edge, while near the edge the resultant repulsion will be away from the surface and from the greater angle with the normal the nearer the ray is to the edge. This would prove of course that the repulsion is not an electrostatic one, for in that case it would always be at right angles to the surface. If the exhaustion is such that the glass becomes phosphorescent, the phosphorescence, being produced by the rays proceeding from the cathode, it is clear, will form a luminous ribbon surrounding the electrode, which is a little larger than the electrode.

If now a solid body is introduced between the cathode and the glass inclosure, a shadow of this body will appear in the phosphorescent light on the glass; the formation of the shadow is a direct consequence of the rectilinear propagation of the rays.

We now proceed to describe Dr. Goldstein's experiment in its simplest form.

In a cylindrical vessel two parallel electrodes of equal length are introduced at one end, while the other end contains a third electrode which shall always form the anode. Let the pressure be such that phosphorescence appears, and let only one of the two parallel electrodes be connected with the negative pole of the coil, while the other is insulated. A shadow of this insulated wire is seen in the phosphorescent light on the glass. Now let the insulated wire be brought into metallic contact with the other electrode, and the whole appearance will change. In the phosphorescent light of the glass we shall see two dark surfaces of equal size and shape, and with distinctly marked edges. The two dark surfaces are situated in such a way that a plane which passes through the electrodes cuts them into two equal halves. They are partly bounded by straight lines, partly by two semicircular arcs.

The parts formed by straight lines are parallel to the electrodes, and of equal length; these straight lines are joined at the lower end, that is, at the free end of the electrodes, by means of a half circle, which is partially repeated at the upper end; but where the electrodes are sealed into the glass the curve is interrupted. The dark surfaces are bordered by a bright line of light. It will facilitate the understanding of the position and shape of these dark surfaces if we mention already here that they are such as would be produced if the rays emanating from each electrode, and propagated in a normal direction from it, suffer a repulsion and consequent deflection in the neighbourhood of the other electrode, so that the dark space is formed by the absence of the phosphorescent light which would be produced by the rays coming from the farther cathode.

We cannot here give the further description of shape and the measurement of the size of these dark surfaces, but at once describe their properties. In the first place the size and shape are altogether independent of the position, form, and size of the positive electrode. The relative position of the two cathodes, on the other hand, materially affects their behaviour; and Dr. Goldstein gives their shape, for instance, if, instead of being parallel, they are at right angles to each other, either in the same plane or one in front of the other. We have already stated that in the case of parallel electrodes the parts of the outline forming straight lines are of equal length with the electrodes, and hence the length of these dark surfaces increases with the length of the electrodes, but the breadth and half-circle joining the straight lines does not vary with the length of the electrodes. The further removed the glass walls are from the two electrodes the greater is the width of the surfaces. All these and other properties follow at once if we consider that the luminosity is produced by the intersection of the rays proceeding from the cathodes with the glass walls. If we increase the thickness of one of the electrodes, the size of the dark surface nearest to it is increased. We now turn to the experiments which have been made in order to clear up the cause of the phenomena. By means of very ingenious experiments Dr. Goldstein proves that it is only light produced by the nearer electrode which is seen within the boundary of the dark surface, for although we have called them dark, they are only so by contrast, and they show a faint phosphorescence. Dr. Goldstein had, in a former paper, shown that when the cathode is perfectly smooth, the phosphorescent light produced by the glow shows inequalities. By twisting the aluminium electrodes he could obtain a series of spiral curves in the phosphorescent light more luminous than the rest. If one of the two cathodes is twisted in such a way and connected with the other, the spiral curves are interrupted in the dark space which is removed from the twisted electrode, but they are visible in the dark surface nearest to it.

---

[1] "A New Kind of Electric Repulsion," by Dr. E. Goldstein. (Berlin: Julius Springer, 1880.)

The dark surface cannot be considered as enlarged shadows only of the electrodes, for their shape is different, but they might as regards shape be considered as shadows of the second and non-luminous layer of the negative glow. This remark we believe to be of importance, but Mr. Goldstein shows that they cannot really be such shadows, for they appear even when by an approach of the two electrodes the two non-luminous layers fuse into one and so lose their individuality.

The following experiment proves the repulsion. A metallic diaphragm is introduced between the two cathodes. A small hole is made in the diaphragm with its centre in a line joining the electrodes. Only some of the rays proceeding from each cathode can now reach the next, and consequently we observe only a small phosphorescent speck at the opposite side of the glass wall if one of the electrodes is insulated, but the dark shadow of the nearest electrode is visible in this phosphorescent speck. If now the two cathodes are joined the phosphorescent speck is seen to divide into two which separate and clearly show that the rays producing the phosphorescent light must have suffered a deflection as soon as the two cathodes were joined. Further experiments show that the deflection takes place at right angles to the surface of the electrode, and that it takes place at sensible distances from the repelling cathode, although it rapidly decreases in strength. Near the edge of a repelling cathode the repulsion does not take place in a normal direction, and Dr. Goldstein draws again a distinction between elements of a surface according as they are removed or near an edge. We believe this distinction to be unnecessary, and that all phenomena are explained by the fact that all parts of the electrode are repelling, and not only the elements nearest to the deflected ray.

Some remarkable secondary phenomena take place in a deflected system of rays. If, for instance, a system of rays forming a cone of narrow aperture passes near a second cathode, it is not only deflected but the aperture of the cone is increased. The phenomena are such as would be produced if a cathode not only repels the rays but also induces a state in the particles forming the ray such that they now repel each other. Also parts of the same cathode repel rays proceeding from other parts, and the repulsion increases the thicker the electrode. All these facts are illustrated and proved by a series of well-arranged experiments. Dr. Goldstein next examines the influence of an anode, but we shall not follow him, as it is found that the effect of an anode is exceedingly small, and most likely always produced by secondary causes.

The deflection is the same in all gases: air, hydrogen, carbonic oxide, and magnesium vapour having been tried.

The deflection is independent of the metal of which the cathode is formed; it is independent of the pressure. It is also independent of the intensity of discharge when the two electrodes are in metallic contact, so that the current is equally divided between the two cathodes. But remarkable changes take place if the current is not so equally divided. This can be done by joining the electrodes not metallically, but with a bad conductor, as for instance a moist thread. It is then found that the dark surface nearest the cathode through which the smaller discharge passes is much reduced in size, while the other dark surface is increased. It follows from experiments such as this that the repulsion does depend on the intensity of discharge, but that while a cathode through which more electricity passes more strongly repels, a ray which proceeds from such a cathode is less strongly deflected. If therefore we have seen that the dark surfaces do not vary in size, whatever the intensity of discharge, if the two poles are connected with a piece of metal; this is due to the fact that each cathode repels more strongly, but that the rays of the other electrode (owing perhaps to the greater velocity of the molecules proceeding from it) are less easily deflected, and that the two effects counterbalance each other. Dr. Goldstein considers, rightly no doubt, that the shadows seen when one apparently insulated metallic body is introduced between the cathode and the glass are due to a similar repulsion, because we may consider that a small part of the discharge always passes through such a body, the glass into which the body is necessarily sealed not being an absolute non-conductor. The shape of the shadow confirms this supposition.

Dr. Goldstein has also obtained the repulsion from electrodes consisting of glass and mica, so that the metallic or non-metallic nature of the electrode does not influence the phenomena. He has also proved that the source of electricity is immaterial, as might have been expected.

Dr. Goldstein has also endeavoured to prove that the deflecting power of a cathode does not act through a solid screen, but he has chosen metallic screens for his experiment.

If the repulsion is of the nature of electric repulsion a metallic body might act as a screen, while a non-metallic body would allow two bodies on opposite sides of it to repel each other. As it is impossible to form any idea on the cause of these phenomena unless we know whether the deflecting power is cut off by any solid body, it is much to be wished that Dr. Goldstein will repeat his experiments with non-metallic screens.

In the last part of his book Dr. Goldstein discusses various theories which might be proposed and have been proposed for the explanation of the phenomena taking place in the neighbourhood of the negative electrode. The result is that none of them are satisfactory. While this no doubt is true, Dr. Goldstein is too severe, we believe, in his criticisms of some of the suggestions which have been made, and which may, in our opinion, after all contain the germ of the true explanation, though in their present shape they may not be quite satisfactory. Some of the facts which to Dr. Goldstein are sufficient to reject a theory may, we believe, be explained without putting too great a strain on our present ideas, and sometimes we believe Dr. Goldstein to be in error, as when, for instance, he says that a body must necessarily move in a line of force. It would at least be a sad look-out for our earth if this was true, and Dr. Goldstein would in that case have occasion to study before long the electric phenomena on the surface of the sun. We will hope, for the sake of science, that both Dr. Goldstein and his molecules do not always move in lines of force, and that he will often favour us with such interesting and valuable contributions as the one before us.

ARTHUR SCHUSTER

PHYSICS WITHOUT APPARATUS[1]

VII.

IN the preceding articles on "Physics without Apparatus" it has been shown how a large proportion of the fundamental experiments in most branches of physics can be performed without employing expensive apparatus.

The next of these branches to claim consideration is the science of optics. Here again, as in electricity and in heat, we find that, while the higher quantitative laws of the science require for their experimental proof apparatus of the finest and most exact and therefore most expensive nature, the *elementary facts* of experiment are readily demonstrable with little or no apparatus of a formal kind.

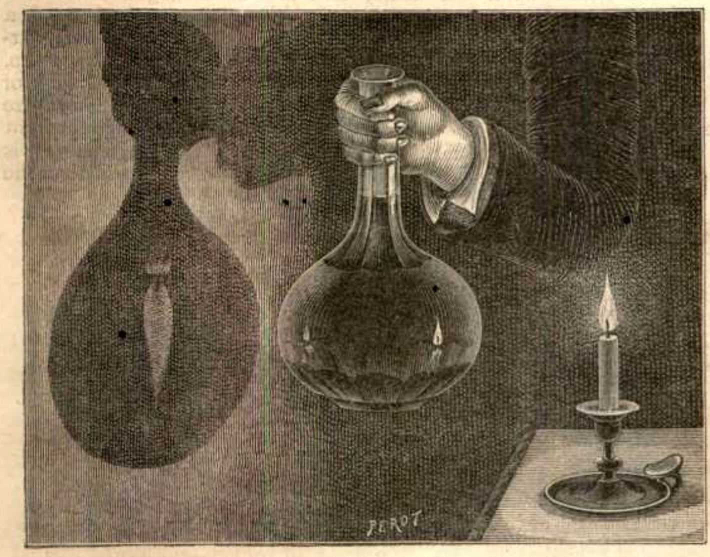

FIG. 22.

An ordinary looking-glass, a lighted taper, and a foot-rule or a measuring tape are quite sufficient to demonstrate the simple geometrical laws of reflection; for with their aid it is very easy to show that the image of the candle in the mirror is virtually situated at a distance behind the mirror equal to the actual distance of the candle in front, and that, when a ray falls obliquely on the mirror, the angle of incidence is equal to the angle of reflection. A teacher who wishes to go further into the matter, and to demonstrate the laws of reflection at curved surfaces, usually provides himself with the appropriate silvered mirrors of convex and concave form. Failing these, the exterior and interior surfaces of the bowl of a bright silver spoon will probably be as satisfactory a substitute as any. We have found even a saucer of common glazed earthenware to form a very fair concave mirror, giving upon a small tissue paper screen a beautiful little inverted image of a distant gas flame.

To illustrate the geometrical laws of refraction through lenses, a good reading-glass of large size is a desirable acquisition. Spectacle-lenses, though of smaller size, and therefore admitting less light, are also of service. In the absence of any of these articles, it is generally possible to fall back upon a water-decanter, provided one can be found of a good globular form, and not spoiled for optical purposes by having ornamental work cut upon the sides of the globe. Fig. 22 shows how this decanter, filled with water, is to be employed. It is held a few inches away from a white wall, and a candle is placed at the opposite side, so that its light falls through the decanter on to the wall. The candle is moved towards or away from the decanter until the position is found in which its rays focus themselves upon the wall giving a clear inverted image of the candle flame upon the wall. The experiment may be varied by setting down the candle on the table and then moving the decanter to and fro until a definite image is obtained. If a large hand reading-glass be available, the image will be much clearer than with the improvised water-lens; and a further improvement in the manner of experimenting may be made by using a screen of white paper or card instead of a whitened wall on which to receive the image. The sheet of paper should be set up in the simple fashion shown in Fig. 24, at one end of a table. The candle should be placed at the other end of the table, and the reading-lens moved about between them until a point is found at which it throws upon the screen a good clear image of the candle. It will be found that there are two such points, one near the candle, the other near the screen. In each case the image of the candle will be inverted, but in the first case it will be a magnified and in the second a diminished image, the size of the image, as compared with that of the real flame, being proportional to their respective distances from the lens. When the lens has been placed in a position of good focus, the candle may be removed and placed where the screen stood; if now the screen is placed where the candle was, it will be found that the image is again visible on the screen, still inverted, though altered in magnitude. This experiment, in fact, proves the law of conjugate foci.

The young beginner in science who repeats these experiments for himself will begin to understand how it is that in the photographer's camera the image in the instrument is inverted, and how it can also be true that the images cast on the sensitive retina of the eye are also inverted. The retina at the back of the eyeball answers to the white screen on to which the image is

FIG. 23.

---

[1] Continued from p. 489.

thrown by the lens in front of it. It is possible indeed to show in actual fact that the image in the eyeball is inverted; the experiment is very simple, but we believe that this is the first time that it has been described in print. Take a candle, and hold it in your right hand as you stand opposite a looking-glass. Turn your head slightly to the left while you look at the image of yourself in the glass. Open your eyes very wide and look carefully at the image of your left eye. Move the candle about gently, up, down, forward, &c., so that the light falls more or less obliquely on to the eyeball. You will presently notice a little patch of light in the extreme outer corner of the eye; it is the image of the candle on the inside of the eyeball, which you see through the semi-transparent horny substance of the eye. If you move the candle up, the little image moves down, and if you succeed well, you will discern that it is an inverted image, the tip of the flame being downwards. You thus prove to your own satisfaction that the image of the candle in your eyeball is really upside down.

Fig. 23 shows a magnifying-glass of very simple construction, which a few years ago found a great sale in the streets of London, at the price of one penny. A bulb blown at the end of a short glass tube is filled with water. When held in front of the eye, this form a capital lens for examining objects of microscopic dimensions, which may be secured in place by a bit of wire twisted round the stem.

The principle by which the intensity of two lights is compared in the photometer is very easily shown. The arrangement depicted in Fig. 24 shows how to measure the relative brightness of an Argand oil-lamp and of an ordinary candle. Both these lights are set upon the table, and are so arranged that each casts on to a screen of white paper a shadow of a tall narrow object. The most handy object for this purpose is another candle unlighted. The Argand lamp, being the brighter light, will cast the deeper shadow of the two, unless it is placed further away. The measure of the brightness is obtained by moving the brighter light just so far off that the intensity of the two shadows is equal, for then we know that the relative intensities of the two lights are proportional to the squares of their distances from the photometer. All that remains, therefore, is to measure the distances and calculate out the intensities. If, for example, the distance of the lamp is double that of the candle when the two shadows are equally dark, we know that the brightness of the lamp is four times as great as that of the candle.

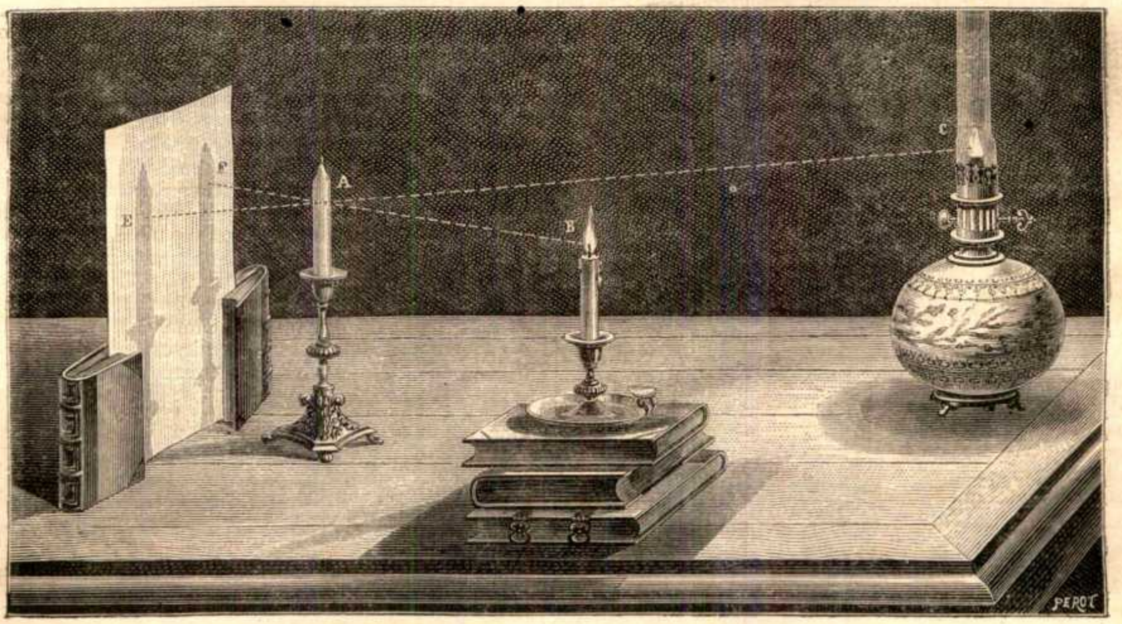

FIG. 24.

Many other facts in optics can be shown with no greater trouble than that entailed by such simple experiments as we have described. The pendant lustre of a chandelier will provide an excellent prism of glass for showing the dispersion of light into its component tints. A couple of spectacle glasses appropriately chosen will, when pressed together, afford capital "Newton's rings" at the point where they touch. Diffraction bands of gorgeous hue may be observed by looking at a distant gas-light, or at the point of light reflected by a silvered bead in sunshine, through a piece of fine gauze, or through a sparrow's feather held close in front of the eye. And yet more remarkable effects of diffraction are obtained if the point of light be looked at through substances of still finer structure, such as the preparations of woody structure, and of the eyes of insects which are sold as microscopic objects. But the explanation of these beautiful phenomena would lead us far beyond our subject.

(*To be continued.*)

THE JAMAICA HURRICANE AND THE BOTANICAL GARDENS

THE following letter from Mr. Morris has been forwarded to us from Kew for publication :—

Botanical Department, Gordon Town,
Jamaica, September 7, 1880

At the Cinchona Plantation, besides damage to our buildings and sheds of about 650*l.*, our nurseries and seed beds have suffered so much as to reduce our stock of available seedlings from something like 500,000 down to 80,000. These were intended for planting out in the latter part of this year and the beginning of the next year. We shall in consequence be unable to distribute seedlings as we intended, and so suffer considerably in expected revenue. At the plantations vegetation is so literally swept away that only here and there can we see a standing tree. There is not a leaf left on either the indigenous or cinchona-trees. After a careful inspection we have estimated that 20,000 cinchona-trees of all ages have been uprooted or so severely damaged that they must be immediately barked. Though we had given up barking definitely till the return of dry weather next year, we are now obliged to take it up with great energy and send the bark down to be dried in the plains. We hope to get a return of about 1,500*l.* to 1,800*l.* for "broken and twiggy" bark, but this will be but a poor result considering the sacrifice made to secure the bark at all hazards before it has dried and hardened on the trees.

Out of the small garden at Castleton, covering only about five to six acres, I found fifty-five trees destroyed, and ninety-eight severely injured. Out of the trees severely injured, *i.e.* probably blown quite down and put up again with trimmed limbs and supports, I found the Para-rubber mangosteen, Tonquin-bean, cam-wood, olive, cinnamon, nutmeg, East Indian mango, chocolate, Liberian coffee, &c. Even if they live we shall get no fruit from them during the next season, and we shall be unable to supply plants in great demand for some time.

I am glad to say that the superintendent did not suffer personally, though the roof of the residence was partially blown away, and the office canted almost on its side.

The Parade Garden, Kingston, felt the hurricane greatly, but as we had nothing there except ornamental trees and shrubs we hope to recover our losses soon.

The cocoanut plantation at the Palisadoes had sixty-one bearing trees blown down, and forty-one rather young ones just coming into bearing. This plantation is on a narrow spit of sand running six miles out and inclosing Kingston Harbour. The force of the wind being from the south and against the plantation, the waves broke over it at several places, and the harbour being consequently filled, much damage was done to the wharves and shipping.

You will, I am sure, be sorry to hear that the Old Bath Garden has also shared in the general injury. The fine old cinnamon-tree, the camphor-tree, and the pinus are down. Till the place is cleared the keeper is unable to give me fuller particulars.

The King's House Gardens and grounds have fortunately escaped much injury. D. MORRIS

NOTES

MESSRS. CHARLES GRIFFIN AND CO. announce that they have at last in the press the memorial volume to the late Prof. Macquorn Rankine. It is entitled "A Selection from the Miscellaneous Scientific Papers of W. J. Macquorn Rankine, C.E., LL.D., F.R.S., late Regius Professor of Civil Engineering and Mechanics in the University of Glasgow, from the *Transactions* and *Proceedings* of the Royal and other Scientific and Philosophical Societies, and the Scientific and Engineering Journals, with an Introductory Memoir of the Author, by P. G. Tait, M.A., Professor of Natural Philosophy in the University of Edinburgh; edited by W. J. Millar, C.E., Secretary to the Institution of Engineers and Shipbuilders in Scotland." The volume will contain many papers of great weight and value, at present to be found only in the Records of the various scientific and philosophical societies, and in the scientific and engineering journals, to which they were originally contributed, and therefore inaccessible to the majority of scientific workers. No doubt the bringing-together in one volume of these successive important contributions to science will be acceptable to all who knew of Rankine's high position in science. A fine portrait on steel will be prefixed to the volume.

WE have a few further details on the meeting of the German Association at Danzig. Salzburg was unanimously chosen as the town in which the next year's congress of the Association should be held. Dr. Wernicke of Berlin gave an address "On the Scientific Standpoint in Psychiatry," and in the section for physics and meteorology Dr. L. Weber read a paper upon "Lightning Strokes in Schleswig-Holstein." In the section for the superintendence of instruction in mathematics and natural science Dr. Feyerabendt spoke with reference to mathematical school-books, which, as he showed, would bear much simplification and condensation. A point which he urged among others was that the matter taught should be divided, not upon scientific principles, but with regard to its easy and ready comprehension by the scholar.

THE death is announced, on August 22, of the Hon. John Imray, M.D., of Dominica, West Indies. Dr. Imray had done much for the botany of his island, but is best known for his successful efforts to introduce Liberian coffee and the cultivation of limes into the West Indies. Another death is that of M. Edmond Barbier, the translator into French of some of the works of Mr. Herbert Spencer and Sir John Lubbock, at the age of forty-six years.

A LAUDABLE innovation has been made in the library of the French Academy, which is not open to the public. Any one wishing to consult any of the rare and precious books in the library has only to make an application to the librarian to receive the required authority.

DR. WATT, of the Bengal Educational Department, who is now engaged in the examination at Kew of his extensive collections of Indian plants, has been deputed by the Government of India to visit Manipur, on his return from furlough, for the purpose of reporting on the forest and vegetable resources of that territory.

Science, the new American record of scientific progress, states that the Rev. W. H. Dallinger has consented to become Governor and Professor of Natural Sciences of Wesley College, Sheffield, U.S.A.

MR. JAMES BLYTH of Edinburgh has been elected to succeed Prof. Forbes in the Chair of Natural Philosophy at Anderson's College, Glasgow.

DR. J. VOSMŒR of the Hague intends publishing a detailed bibliography of the sponges, and it is to be hoped that all authors of works or papers on this interesting group will send copies of their writings to him at 73, de Ruyter Straat, Haag, Holland.

THE bureau of French meteorology has been revived for 1880-81, M. Hervé Mangon being continued president.

THE recent change of Ministry in France has brought forward for the second time since 1870 the Minister of Public Instruction to the direction of the Cabinet. M. Barthelemy St. Hilaire, the new head of the French Foreign Office, is not only a member of the French Senate, but also of the Academy of Moral and Political Sciences. He has published a large number of works on philosophy, among which the most considerable is a translation of the whole works of Aristotle, with a commentary. In order to be better able to understand physics and mechanics, he studied mathematics at the age of forty-five under the direction of his friend Corioles, then scientific director of the Polytechnic School. He was an intimate friend of Leverrier. He was born in Paris in 1809, and has just completed his seventy-first year.

THE Birmingham Natural History Society, which has hitherto met in the Midland Institute, has been provided with ample accommodation in the Mason Science College. The Society, which numbers 400 members, is making an effort to fit up the rooms in an appropriate and comfortable manner.

THE Epping Forest and County of Essex Naturalists' Field Club held the seventh, and probably the last, of the summer course of field meetings at High Beech and Monk's Woods on the 2nd inst., the purpose of the meeting being the observation of the *cryptogamic* flora of Epping Forest. The conductors were Dr. M. C. Cooke, Mr. Worthington Smith, F.L.S., Mr. James English, and Mr. E. M. Holmes, F.L.S.; and the party (upwards of fifty in number) included many well-known London naturalists. Several scarce *fungi* were noticed, although the weather proved very unfavourable for field-work. After tea, botanical demonstrations were given, one of the speakers being Prof. Max Cornu of Paris, who expressed the pleasure he had in being present, and said that he hoped to establish similar meetings in Paris. It is intended to make this "fungus meeting" an annual institution.

DR. ANDREW WILSON, F.R.S.E., has in the press a new work entitled "Chapters on Evolution," in which a popular *résumé* of the Darwinian and other theories of development is to be given. Messrs. Chatto and Windus are the publishers.

THE French Minister of War has authorised the erection of a meteorological observatory in the fort which has been recently constructed in the Ballon de Servance, in the Vosges.

THE Rev. A. E. Eaton states (*Entomologists' Monthly Mag.*) that "in Lisbon male field-crickets are sold in miniature cages by bird-fanciers at the rate of a penny a-piece. They are kept in stock by hundreds together in open tea-chests, lined for the first three or four inches from the top with slips of tin, and are fed upon lettuces. The natives like to have a 'grillo' chirping in the room, and make pets of them." Has this, or a similar custom, been observed by travellers in other parts of the South of Europe? No doubt there is a superstitious element in it, on the principle that sometimes induces our own people to send to the bakers for house-crickets "for luck." In China, and elsewhere, other Orthopterous insects are well known to be sold in little cages.

HITHERTO, we must confess, Trinity College, London, has been somewhat of a *nominis umbra* to us; but with its fat Calendar before us it can be so no longer. It was established in 1872 mainly for the promotion of musical education. The Council, we are glad to see, take a liberal view of what is necessary to constitute a well-educated musician, and provide the means of a really liberal education. There is a faculty of music in which, among other subjects, the physiology of the vocal organs and of the ear is taught. In the faculty of arts, besides ancient and modern languages, there are classes in mathematics, chemistry, zoology, botany, geology, and physiology. The College has not only its curriculum for students in London, but has centres for examination all over the three kingdoms, and judging from the lists of names of those who have passed, these examinations must be widely taken advantage of. The Calendar contains all necessary information as to the College and its work, with the examination papers for the past year and other matters. If it is able to carry out its programme, the institute ought to do much good.

AT the Exhibition in connection with the Sanitary Congress which has been held at Exeter, there are several things worthy of some notice. It may be mentioned that the marked features of the collection are the gas stoves, improved flushing apparatus, ranges for the saving of fuel, various appliances for house drainage, ventilation, and arrangements to prevent sewer gas from rising into houses through closets and sinks. The number of manufacturers who exhibit under these heads shows the principal directions in which practical sanitarians are working. First as to the gas-stoves. These are divided into heating-stoves and cooking-stoves. In the heating group the object is to attain as much radiation as possible; in the cooking group the object is to prevent loss of heat by radiation. The Exeter Gaslight and Coke Company, believing that gas will soon supersede coal for heating and cooking, whilst it will itself be superseded as a lighting agent, have offered four handsome silver medals for the best stoves. It is stated on the authority of a late cook of the Reform Club that the gas kitchener No. 99 in Class III. cooked 13 lbs. of meat in fifty-one minutes, at a cost of three farthings, the gas being at the rate of 3*s*. 6*d*. per thousand. The graduation of heat can be effectively regulated by the tap of the pipe which secures the gas burners. The gas water-heaters shown are of two kinds—those in which the gas jets are introduced under the bath, and those in which they are introduced into a separate boiler placed in the bath-room or outside it. No. 25, Class III., is an example of an upright cylindrical boiler with which water enough for a bath can in twenty minutes be obtained at 95°. It is impossible to draw attention to all the novelties, but there are some few deserving special attention. Class II., No. 3, is a "twin" door. Two doors a few inches apart are hinged so as to open together. There is an open space for ventilation between them. For housemaids' sinks on different landings, for closets, and for sculleries and kitchens, they are invaluable. In filters there is not much new. A French firm shows a modification of their well-known filters, it being an adaptation of their principle to table filters with the use of Carferal. The main point is that the Carferal can be so readily changed; and it is now well recognised that no filtering material is of any good after many days' use. The trouble involved is no more than that of making tea, and a lady can see to it herself without being at the mercy of careless servants.

THE *St. James's Magazine* for October contains the first instalment of an interesting series of articles on "Lightning Protection for Telegraphs."

THE remains of a lake village have been discovered in a marsh at Regnate, near Milan. They include, it is stated, shavings of flints apparently cut with bronze instruments.

THE *Daily News* Naples correspondent writes that in the excavations commenced a short time ago at Villagrande (Sardinia), there have come to light some instruments which are very remarkable if, as believed by competent persons, they belong to the bronze epoch, which, it is asserted, was exceptionally prolonged in this part of the island. The instruments in question are two bronze saws and a four-pronged fork, all is said to be found in the same repository. Near Taranto, in some new excavations opened in the vicinity of former ones, there have been found twenty-two skeletons, each in its respective tomb, not far below the surface of the ground. The tombs are all dug in the rock, disposed in various positions, and covered with square slabs of stone. Some of them were capable of holding two corpses.

MR. PFOUNDES will hold, on Saturday afternoon, at 1, Cleveland Row, St. James's, the first of a series of meetings at which Japanese art with native sketches, photographs, &c., will be exhibited, and some account given of the country and people.

THE Philadelphia Court has forfeited the charters of the Eclectic Medical College of Pennsylvania and the American University of Philadelphia for selling bogus diplomas. These were the medical colleges managed by Dr. Buchanan, who is now awaiting his trial here.

THE exhibition of the Photographic Society opened at the Galleries, 5A, Pall Mall East, on Monday, and is quite worth a visit. There are several productions of special interest: among these are some fine photographs from Novaya Zemlya taken during the second Dutch Arctic Expedition last year; several excellent views of the Tay Bridge disaster; Burnham Beeches, by Lieut. L. Darwin, R.E.; magnificent portraits of lions and tigers taken, we presume, in the Zoological Gardens; several beautiful views taken of Siam, including a group of Laotian huts. There are also several specimens of new apparatus used in photography.

An important innovation has been made in all the French colleges by M. Ferry. Any pupil wishing to be promoted to a superior class is obliged to pass an examination. The Government is asking important credits for the rebuilding of the principal colleges of Paris and the construction of new colleges outside of the fortifications.

Education is the title of a new international bi-monthly magazine, devoted to the science, the art, the philosophy, and the history of education. It is published at Boston, Mass., and by Trubner and Co., London.

A useful exhibition is being held in Glasgow of apparatus for the utilisation of gas, electricity, oils, &c., and of hydraulic, architectural, mining, and sanitary appliances.

Under the name of Tong-pang-chong a Chinese remedy for skin diseases was brought to European notice some two years since. The material as brought to this country appeared like fragments of a woody root, and it was said to be produced by a plant growing in Siam, from whence it is sent to China, where its use had become quite general. From subsequent information received from China and from examination and comparison of specimens sent to this country with those already contained in the Kew Museum, there seemed but little doubt that the plant which produced the Tong-pang-chong of the Chinese was *Rhinacanthus communis*, an acanthaceous plant. A good deal of interest was attached to this remedy when it first came to notice, since which time nothing has been heard of it until within the last few weeks, when some of the material has been received in this country, and is now in the possession of Messrs. Christy and Co. of Fenchurch Street. Whether this consignment will prove to be identical with *Rhinacanthus communis*, and so prove the accuracy of the preliminary determination which was made from scant materials, or whether it will turn out to be produced by a distinct plant will no doubt, shortly be seen. The remedy is referred to in the *Kew Garden Report* for 1877, p. 41.

Herr Tornöe has published in the *Sitzungsberichte der k. Akademie der Wissenschaft zu Wien* (81, 924) a detailed account of the estimations of salt in the Norwegian Sea, conducted by him during the late Norwegian North Sea Expedition. The paper is a valuable contribution to the physical history of the North Sea.

The monster python which is kept alive in the Antwerp Museum having had inflammation of the jaw, a Belgian doctor volunteered to enter its cage in order to cure it; but the brute attempted to suffocate the poor doctor, who was glad to escape with his life.

The Queenwood College Mutual Improvement Society seems to be doing much to encourage the study of natural science among its members. The Report of the Committee for the last summer term speaks highly of the various collections made for the exhibition; several useful papers were read and interesting excursions made.

In the report of the awards made by the different juries of the Exhibition of Agriculture and Insectology at Paris it is stated that a public company has been formed in Spain for the rearing of the silkworm fed on the oak, and the number of cocoons to be collected this year will probably amount to no less than three millions. A special machine for weaving this new silk has worked during the whole time that the Exhibition has been open. A medal was awarded to an exhibitor for a lamp specially arranged to catch insects. It is suggested in the report that the same experiment should be tried by electric light, and a recent instance has been quoted to prove that it would be really successful. A certain number of electric lights, for ordinary illuminating purposes, were used this summer in the gardens of the Meaux Exhibition, in the vicinity of the Forest of Fontainebleau. No arrangements were made for catching the insects, and they fell round the lamps, except a few that got admittance through the holes of the regulator. The number of the latter was so large that two of these lamps placed at a coffee stall in the open air had to be removed, all the consumers being covered by moths of every description.

The piscicultural experiments at Ercildoune, Victoria, Australia, have been unusually successful; 9,100 ova were collected, of which 2,000 were salmon trout.

The additions to the Zoological Society's Gardens during the past week include a Purple-faced Monkey (*Semnopithecus leucoprymnus*) from Ceylon, presented by Mr. Wm. Collingwood; a Macaque Monkey (*Macacus cynomolgus*) from India, presented by Mr. Henry Thimbleby; a White-cheeked Capuchin (*Cebus lunatus*) from Brazil, presented by Mr. Henry Ch. Marckman de Lichtabbell; two Common Cranes (*Grus cinerea*), European, presented by Mr. Norman W. Shairp; a Rose Hill Parrakeet (*Platycercus eximius*) from New South Wales, presented by Mr. Charles Porter; a Common Chameleon (*Chamæleon vulgaris*) from North Africa, presented by Mr. Percy Day; a West African Python (*Python sebæ*) from West Africa, presented by Dr. F. Speer; a Bless-bok (*Alcelaphus albifrons*) from South Africa, a Prince Albert's Curassow (*Crax alberti*) from Columbia, deposited; a Sulphur-breasted Toucan (*Ramphastos carinatus*) from Mexico, purchased.

OUR ASTRONOMICAL COLUMN

The Binary Star α Centauri.—Mr. W. L. Elkin, who has been recently a student at the University of Strassburg, has given, in a dissertation for the degree of Doctor, a new determination of the orbit of this remarkable star, in which he has had the advantage of a fine series of measures executed by Sir T. Maclear, Mr. W. Mann, and Mr. G. Maclear at the Royal Observatory, Cape of Good Hope, collected and forwarded to him by Mr. Gill. We subjoin his elements, which, though not considered definitive, yet appear to represent the whole course of micrometrical measures very satisfactorily. Mr. Gill's measures in 1877 seem to indicate well the position of the companion about its nearest approach to the principal star, which it was feared at one time there would be danger of losing at this passage of the periastre. For the sake of comparison the provisional orbit deduced in 1879 by Dr. Doberck is annexed; the most noticeable difference is in the period of revolution.

	Elkin.	Doberck.
Passage of periastre	1875·97	1875·12
Node	25° 47′	25° 32′
Node to periastre on orbit	54° 47′	45° 58′
Inclination	79° 32′	79° 24
Excentricity	0·5260	0·5332
Semi-axis major	17″·50	18″·45
Revolution	77·42 years	88·536 years.

Mr. Elkin's orbit gives the following angles and distances:—

1880·0	Position	185°·7	Distance	4″·79
1881·0	,,	192·4	,,	6·81
1882·0	,,	196·1	,,	8·70
1883·0	,,	198·5	,,	10·42
1884·0	,,	200·2	,,	11·98

For the absolute parallax of α_2 Centauri, he states that the series of 156 altitudes observed on the same days, directly and by reflection with the Cape circle in the years 1856-60, assigns + 0″·798 ± 0″·068; Moesta from observations at Santiago had found 0″·88. Although a large parallax, the largest perhaps yet detected, may still be attributed to this star, it appears to be Mr. Elkin's conclusion that it yet remains to be determined within very narrow limits. Probably Mr. Gill, with the aid of the heliometer, may in due course give a good account of it.

THE VARIABLE R HYDRÆ.—Dr. Gould, at Cordoba, has given much attention to the changes in this variable star, respecting which Argelander remarked that so long as observations were confined to European latitudes little would probably be understood, and he has deduced a formula closely representing the observations, excepting one by Maraldi, about which there appears to be a large error. The earliest recorded observations of this celebrated variable Dr. Gould remarks were those of Hevelius in April, 1662, published in the scarce volume of the "Machina Cœlestis" in 1679. Montanari of Bologna comparing Bayer's Uranometry with the sky on April 15, 1670, remarked it as a star of the fourth magnitude, not entered upon the map, and notified it as a new object. Its variability was recognised by Maraldi at Paris in 1704, who watched it at intervals till 1712. There then appears to be a gap in the observations until we come to those of Pigott in 1784 and 1785. Argelander collected and discussed all the observations to the beginning of 1863, and deduced a formula which fairly represented the data since 1784. The length of the period is decreasing rapidly, amounting, as Dr. Gould says, to more than nine hours at each successive recurrence—a circumstance which impeded the determination of the number of periods elapsed between Montanari's observation in 1670 and the first maximum noted by Pigott. Twelve periods having elapsed since the latest maximum included in Argelander's investigation, present data allow of clearing up several doubtful points.

Dr. Gould finds that the number of periods between the maxima of 1670 and 1784 must have been eighty instead of eighty-four, as assumed by Argelander, and the number between the maxima of 1670 and 1704 must have been twenty-three instead of twenty-five. Assuming that Maraldi's second maximum is erroneously dated in 1708, instead of 1707, he finds that all existing observations except Maraldi's first, may be represented within quite tolerable limits, "by supposing a uniform diminution in the period, upon which are superposed variable terms, according to which a symmetric perturbation completes its cycle in seventy-two years," and the following formula is finally inferred. The days are counted from the beginning of the year 1875:—

$$T = 35{\cdot}6\text{d.} + 434{\cdot}445\text{d.}\, n - 0{\cdot}37974\text{d.}\, n^2 + 32{\cdot}0\text{d.} \sin(5^\circ n + 10^\circ)$$
$$+ 2{\cdot}6\text{d.} \sin(10^\circ n + 324^\circ) + 6{\cdot}8\text{d.} \sin(15^\circ n + 205^\circ)$$

It will be found that the formula fixes the next maximum to January 18, 1881; Schmidt alone has observed the minima, which occur on the average at about 9-16ths of the interval between the maxima.

A NEW COMET.—On the evening of September 29 Dr. Ernst Hartwig of the Imperial Observatory, Strassburg, discovered a bright comet about 10° north of Arcturus, and having obtained observations on three consecutive nights, has calculated the following elements:—

Perihelion passage, September 6·9528 M.T. at Berlin.

	°	′
Longitude of perihelion	80	0·6
,, ascending node	43	32·3
Inclination of orbit	38	48·3
Logarithm of perihelion distance	9·56450	

Motion—retrograde.

Hence he finds, for Berlin midnight:—

	R.A. h.	m.	s.	Decl. °	′	Log distance from Earth.	Sun.
Oct. 6	16	7	40	+24	35·5	9·8147	9·9231
8	16	29	22	22	46·2	9·8488	9·9432
10	16	47	18	21	3·5	9·8827	9·9623
12	17	2	15	19	29·6	9·9158	9·9805
14	17	14	51	+18	5·0	9·9476	9·9978

The intensity of light is rapidly diminishing, being on October 14 only one-sixth of that at the time of discovery.

The above orbit places the comet at 6 a.m. G.M.T. on September 12 near to Regulus, so that it is distinct from the object notified by Mr. Lewis Swift of Rochester, N.Y.

The comet was seen for a few seconds between clouds at the Royal Observatory, Greenwich, and at Mr. Barclay's observatory, Leyton, on the 5th, and is described by Mr. Talmage as "very bright," with a long tail."

CHEMICAL NOTES

IN connection with the subject of water of hydration the results of Van Bemmelen, described in the *Berliner Berichte*, are of interest. He has determined the quantities of water parted with, and also taken up by various hydrated oxides under different conditions of temperature and humidity of surrounding atmosphere. The results afford another instance of the graduation of chemical into physical actions. The amount of water taken up varies but little, but the strength of the combination varies much. The formation of hydrates appears to be a function of molecular weight of the oxide and of the temperature.

TWO papers of great importance by Thomsen have just appeared in the *Berliner Berichte*. Thomsen attempts to base a general theory of the structure of carbon compounds on thermal determinations. He does this by measuring (indirectly, of course) the heat of dissociation of the carbon molecule, and from this and other data, finding a thermal value for the combination of two carbon atoms, to form a gaseous compound, by four, three, two, or one "link." Hence he deduces a thermal value for each "link." General equations are given for calculating the heats of formation of various isomers, assuming a certain "linking" of the atoms for each. In cases where various "linkings" may be assumed, a determination of the heat of formation may determine which "linking," and therefore which structural formula, is the more probable.

IN a paper read before the Owens College Chemical Society Messrs. Bevan and Cross detail experiments on jute fibre, which lead them to regard the intercellular portion of this fibre as probably consisting of an aromatic compound of the quinone class, together with a substance allied to the carbohydrates, and somewhat of the nature of cellulose. The presence of this intercellular substance confers on jute the power of retaining various dye-stuffs. The authors also describe a method of separating cellulose from jute fibre, based on the action of chlorine or bromine, subsequent boiling with dilute caustic lye, and washing in acid. Jute fibre which has been acted on by chlorine is coloured deep magenta by immersion in a solution of sodium sulphite. The work of Messrs Bevan and Cross promises results of considerable importance.

MR. O. HEHNER publishes in the *Analyst* the results of his determinations of phosphoric acid in potable waters. He concludes that the presence of more than 0·5 parts per million of P_2O_5 should be regarded with suspicion; also that absence of phosphates affords no positive proof of freedom from pollution.

IT is stated in the *Chemiker Zeitung* that if a solution of two parts of citric and one of molybdic acids be evaporated to dryness, heated to incipient fusion, and dissolved in 30 to 40 parts of water, a solution is obtained which imparts a blue colour to paper immersed in it, and dried at 100°. This paper is bleached by water, and may be used as a test for the presence of water in alcohol, ether, &c.

M. DE SCHULTER states in *Comptes rend.* that he has succeeded in preparing pellucid crystals of analcite by heating a solution of sodium silicate or caustic soda along with aluminous glass in sealed tubes to about 190°.

FROM analyses and determinations of specific heat of cerium tungstate, Cossa and Zecchini (*Gazetta chim. Italiana* for July) think that the atomic weight of cerium is better represented by 92, the number formerly adopted, than by 138, which—or more probably 141—is generally regarded as correct. The data of the Italian observers are as follows:—$Ce_2(WO_4)_3$ ($Ce = 141$) $= 1026$, $\times\ 0{\cdot}0821$ (sp. heat found) $= 84{\cdot}2$, atomic heat of $W = 6{\cdot}4$, of $O = 4$; hence molecular heat of $(WO_4)_3 = 67{\cdot}2$, but $84{\cdot}2 - 67{\cdot}2 = 17$, which $\div\ 2$ gives 8·5 as the atomic heat of cerium. $CeWO_4$ ($Ce = 92$) $= 340$, $\times\ 0{\cdot}0821 = 27{\cdot}9$; but $27{\cdot}9 - 22{\cdot}4$ (that is, molecular heat of WO_4) gives 5·5 as the atomic heat of cerium. The careful determinations of the specific heat of metallic cerium made by Hillebrand, and the general analogies of the cerium salts, must however be regarded as of more value in determining the atomic weight of this metal than a series of estimations of the specific heat of a compound containing oxygen, concerning the influence of which element on the specific heat of compounds thereof we have so little exact knowledge.

THERE has of late been a considerable amount of discussion as to the existence of pentathionic acid, $H_2S_5O_6$. In a recent paper in the *Journal* of the Chemical Society, Messrs. Takamatsu and Smith bring forward evidence which appears conclusively to prove that this acid does exist.

HELL has studied the action of bromine on acids of the acetic series, and in a paper in the *Berichte* he shows that the substitution of bromine for hydrogen proceeds slowly, until from

10 to 20 per cent. of the change is completed, then more rapidly until about 60 per cent. is reached, and then again slowly. He also shows that the greater the molecular weight of the acid the more rapidly is the period of maximum action reached. In these phenomena we have fresh examples of the so-called "Chemical Induction" of Bunsen and Roscoe. This supposed special phase of chemical change would indeed appear to be of very frequent occurrence, being only absent in those changes—if such exist—which consist of a single part, the direct change only.

BERTHELOT, in the *Comptes rendus* of the Paris Academy, describes experiments which lead him to believe that by the electrolysis of dilute sulphuric acid a new oxide of sulphur—S_2O_7—is produced. This substance belongs to the class of peroxides, and is analogous with ozone and hydrogen peroxide; the formation of each of these substances is attended with absorption of heat. From the study of the thermal changes accompanying the solution of chlorine in aqueous hydrochloric acid and in water, the same author thinks that a trichloride of hydrogen, HCl_3, probably exists.

BOUSSINGAULT, in *Annales Chim. Phys.*, has examined the action of heat on barium dioxide under diminished pressure, and has shown that in a vacuum this substance parts with oxygen at a low red heat, and that oxygen is readily absorbed from the atmosphere by the baryta thus produced at about the same temperature, under ordinary pressures. It seems therefore that baryta may be employed as a carrier of oxygen from the atmosphere; hitherto the high temperature required for the decomposition of barium dioxide has brought about some molecular change in the baryta produced, which has rendered it incapable of absorbing more than very small quantities of oxygen from the atmosphere.

IN *Comptes rendus*, Hautefeuille states that he has obtained crystals of orthoclase and of quartz in the same tube by heating a mixture of acid potassium phosphate—previously fused with silica and alumina—with silica and a little potassium fluosilicate in a glass tube.

RADZISZEWSKI in Liebig's *Annalen* gives a careful study of the conditions under which various carbon compounds exhibit phosphorescence; he concludes that this phenomenon occurs with those compounds which combine, in presence of alkalis, with the active oxygen of ozone or other peroxide. Phosphorescence he regards as a special case of the phenomenon of combustion; during slow oxidation active oxygen is produced; hence it is in such processes of oxidation that phosphorescence is noticed. When oxidation is rapid much of the active modification of oxygen is produced, combination occurs rapidly between this and the oxidising substance, and we have the phenomenon of combustion. The phosphorescence of certain organised creatures is due, according to the author, to the slow oxidation, by the agency of active oxygen, of such compounds as lecithin, cholesterin, spermacetti, myricylic alcohol, sugar, fats, or ethereal oils. He shows that these substances are decomposed by cholin and neurin, and generally by bases of the formula $R_4.N.OH$ (where R is a monovalent alcoholic radicle, *e.g.*, CH_3. C_2H_5, &c.), and that this decomposition is attended with phosphorescence.

A SMALL pamphlet, "Report on Two Kinds of Coal submitted by the Chesapeake and Ohio Railroad Coal Agency," published by the Bureau of Steam-Engineering of the U.S. Navy Department, contains a detailed account of the methods of determining on the large scale the relative ratios of steam coals, which must be of very considerable service to any who require to perform such determinations.

IF aluminium hydrate, optained by precipitating a solution of alum by ammonia, be allowed to remain in contact with water for three or four months, it undergoes, according to M. Tommasi (*Comptes rendus*), a molecular change whereby it is rendered very much less soluble in acids, and is no longer capable of forming a compound with aluminium chloride.

PHYSICAL NOTES

THE conditions of geysers are investigated at length by Herr Otto Lang in a recent paper to the Göttingen Society of Sciences (*Nachr.*, No. 6). The theory of Bunsen he considers inadequate, and he proposes another, which has an interesting similarity to that of Mr. Mallet regarding the mechanism of the intermittent volcano at Stromboli.

OBSERVATIONS as to the changes of length of iron bars through magnetisation having been somewhat discordant, Prof. Righi has lately taken up the subject afresh (*Il Nuovo Cim.*, ser. 3, tom. vii.), and, to measure the displacements, he attached a fine steel spring, with mirror, to one end of the bar (which was magnetised by means of a spiral), the mirror being observed through a telescope. Changes in length were thus magnified 8,000 times. The results were as follows:—1. Magnetism produces in iron and steel an increase of dimension in direction of the magnetisation. 2. On cessation of the magnetising force a part of this increase remains, and more or less of it according to the coercive force. 3. The elongations are proportional to the square of the current's intensity when this is not very great. 4. When, after a strong current through the spiral, a weak current is sent in the opposite direction, it produces a shortening; but even when it is strong enough to demagnetise the bar, the latter retains a greater length than in the normal state. 5. During reversal of the polarity of a bar its length becomes momentarily less, and it oscillates in length. 6. A bar or wire of iron traversed by a current contracts at the moment of closing the circuit. 7. On opening the circuit it elongates, but this elongation is less than the initial contraction, indicating that transverse magnetism partly remains. 8. In reversal of the transverse polarity the bar elongates for a moment, and thus oscillates in length. 9. The contraction produced by the current is greater when the bar has before been longitudinally magnetised. 10. Some iron bars show a tendency to take spiral magnetisation, *i.e.* to rotate the magnetic axes of their molecules in the direction of the spiral. This is shown by the contractions caused by a current passing through the bars, which are different according to the direction of the current and that of the previous longitudinal magnetisation.

THE absorption of radiant heat in gases and vapours form the subject of a recent valuable paper to the Vienna Academy (July 1) by Messrs. Lecher and Pernter. They consider "vaporhesion" to have been an important source of error in Tyndall's experiments. In their own method the thermopile and the heat-source were brought into the same vessel. Air-currents were avoided by causing the surface of radiation to be heated in each case suddenly from without, by means of a steam jet, to 100° C. Among other results the absorption of water-vapour is found, in opposition to Tyndall, immeasurably small. Violle found, on Mont Blanc, that a metre of the air absorbed only 0·007 per cent. of the whole radiation; according to this, a layer of 300 m. length would be necessary to produce, with water-vapour saturated at 12°, that absorption which Tyndall obtains in 1·22 m. This and the authors' own experimental results are considered to prove beyond dispute the very small absorption of aqueous vapour. The authors' results for gases agree pretty well with Tyndall's. No simple connection between absorption and pressure of the substance was discoverable. The absorption, even for radiation of a heat-source of 100° C., is selective. The authors found the absorption of certain substances of the fat series examined to increase rapidly with increasing proportion of carbon. It seems to be otherwise, however, with bodies from other groups; thus, *e.g.* benzol, notwithstanding its six C-atoms, has a fairly small absorptive power.

MESSRS. A. P. LAURIE and C. I. Bruton of Edinburgh have devised a new electromotor engine, in which four electromagnets act successively upon an eccentric armature of soft iron rotating about a central shaft, thus avoiding the back pull of Froment's and other forms of electromotor. The gradual approach thereby secured between the armature and the active field-magnets is a feature common to this engine and to that of Mr. Wiesendanger. The principle has long been applied, though somewhat differently, in the little motors employed for whirling Geissler's tubes.

SIGNOR MACALUSO has recently described a new form of mercurial air-pump, on the Sprengel principle, sufficiently simple to be capable of construction from the materials at hand in any chemical laboratory, and requiring no india-rubber connections. An outline diagram of the pump is given in the August number of the *Beiblatter*.

HERR A. SCHERTEL has determined the fusing-points of a number of difficultly-fusible substances by comparing them with those alloys of gold and platinum in various proportions. He gives the fusion-point of basalt as 1,166° C.; that of adularia (from the St. Gotthardt) is stated as being between 1,400° and 1,420°; and nickel between 1,392° and 1,420°.

THE electric conductivity of gas-carbon and its variability under pressure has been re-examined by MM. Naccari and Pagliani. Carbon prisms were carefully covered at certain points of their surface with copper by electro-deposition to secure good contact with the wires by which they were inserted in a Wheatstone's bridge to determine their resistance. When subjected to great pressures the resistances of the rods of carbon showed scarcely any change. Hence it appears that the changes of conductivity which carbon exhibits in the microphone and in the carbon telephone under varying pressures are due not to any alteration of the contact between the particles in the intimate structure of the substance, but to mere changes in the external contact.

DR. WERNER SIEMENS has lately described to the Berlin Academy a new series of experiments on the electric conductivity of carbon, and the way it is affected by temperature. He finds that of gas retort carbon at 0° C. 0·0136 (mercury = 1), and the coefficient of increase of conductivity 0·000345 per degree Celsius. The artificial carbon rods produced by compression of carbon powder also show greater conducting power with increasing temperature, but the increase is not so great (as in retort carbon). Dr. Siemens thinks other experimenters may have been led to erroneous results by faulty connections. He effected the union of the carbon ends with the conducting wires by means of galvanic coppering. The property of conducting better at higher temperatures is regarded as a property of the carbon material itself, not as a consequence of its structure. It may be explained (Dr. Siemens says) as in the case of crystalline selenium, if we assume that the carbon is an allotropic modification (containing latent heat) of a hypothetical metallic carbon.

IN his theory of the bifilar magnetometer Gauss considered that the torsion of the suspending wires, and the induction of the earth's magnetism on that of the suspended magnet, might be neglected, as very small. In the course of several years' observations, Herr Wild having found this to cause serious discrepancy between theory and experience, has (at Pawlowski Observatory) developed the theory anew, taking account of those two factors. Substituting cocoon-threads for wires, he considers the moment of torsion can be reduced to considerably less than 0·3 per cent. of the moment of gravity (it was more than 5 per cent. with wires). The improved theory, while agreeing much better with experience, affords an excellent method of determining separately, from direct observation of the angle of torsion and the three durations of vibration of the magnet in the normal, reversed, and transverse position, its two kinds of induction-coefficients, viz., that in weakening, and that in increase of the magnetic moment by induction; also of determining the temperature-coefficient of magnets and of absolute measurement of the horizontal intensity (*Wied. Ann.*, No. 8).

IT appears from recent experiments by Herr Knoblauch (*Wied. Ann.*, No. 8) that in reflection of polarised heat-rays from metals, the rays of different heat-colours behave differently, in that they have in general different angles of polarisation, presenting, in the case of certain metals, as gold and silver, great differences, and in that of others, as copper and speculum metal, smaller. In the case of lead and arsenic these differences wholly disappear. With the former metals the transitions in reflection of different rays from linear to elliptic vibrations do not keep equal pace with each other; changing the angle of incidence from 0° to the angle of polarisation, the transformation of the vibration of one heat-tint is prominent, while in change of incidence from 90° to the angle of polarisation, it is that of another. With lead and arsenic, at all angles of incidence from 0° to 90°, the ellipses of certain constant heat-rays are always more extended than those of the other heat colours.

GEOGRAPHICAL NOTES

THE full details of the Franklin Search Expedition published in the *New York Herald* of September 23 and following numbers do not contain much of scientific interest in addition to what we gave last week. The narrative contains a graphic and interesting account of the sledge journeys of Lieut. Schwatka's party, of the various Eskimo tribes met with, of the country traversed, and the remains of the Franklin Expedition. Some precision is given to our knowledge of the country, and many valuable hints given as to how to brave an Arctic winter. Although the extreme cold endured, 103° F. below freezing, is not so great as has been experienced in one or two previous instances, we question whether an average temperature of 100° of frost for 16 days was ever before met with. A good many interesting relics of the Franklin party were collected, and there seems no doubt that the Eskimo did at one time have a number of books in a tin box belonging to the party who left the ships; but these, with gold watches and other mysteries, were given to the children for playthings, and have long ago disappeared. It is probable enough that among the books were some records of the progress of the expedition; but all hope of recovering them may now be abandoned. We trust that there will be no delay in the publication of the scientific observations which were doubtless made by Lieut. Schwatka's expedition.

THE new number of the Geographical Society's *Proceedings* provides us with an unusual supply of good readable papers of moderate length. Lieut. G. T. Temple furnishes "Notes on Russian Lapland," accompanied by a new map; the Rev. W. G. Lawes, the well-known missionary, "Notes on New Guinea and its Inhabitants"; the Rev. C. T. Wilson, lately of the Nyanza mission, a brief narrative of a journey over new ground in East Africa from Kagéi to Tabora; and lastly, Major W. M. Campbell, R.E., an account of his visit to the previously unknown (except from hearsay) Shorawak valley and the Toba plateau, Afghanistan. The Geographical Notes supply particulars regarding the murder of Messrs. Carter and Cadenhead in East Central Africa, and Capt. T. L. Phipson-Wybrants' expedition to Umzila's country, east of Matabele-land, as well as a French surveying expedition for West Africa. These are followed by a *résumé* of some of Père Duparquet's notes on Orampo-land, an Egyptian exploring expedition in Somali-land, M. Regel's journey in Eastern Turkestan, and a summary of the Indian Marine Survey Report for 1878–79. There are also some useful additions to our knowledge of Eastern Perak, and an abstract of a Consular report on the Chinese province of Shan-tung. We must not omit to mention that the present number contains the map (postponed from last month) of the country between Sind and Candahar, showing the course of the proposed railway, on which Sir Richard Temple recently lectured before the Society and at Swansea.

THE new expedition despatched by the London Missionary Society to Lake Tanganyika, and consisting of the Revs. A. J. Wookey and D. Williams, with Dr. Palmer, left Zanzibar on June 14, and crossing to the mainland at Saadani, marched thence to Ndumi. Here they remained for a few days, until they got their full complement of *pagazi*, and finally started for the interior on June 21. Accomplishing some twelve or fifteen miles a day, they reached Mpedapwa on July 14, and were most kindly received by the Church Missionary Society's agents. They were to recommence their journey to the lake on July 19. Their caravan consists of 309 men, the chief of whom is Ulia, who accompanied the Rev. Roger Price, when the bullock-waggon experiment was tried some four years ago.

FROM a letter in *L'Exploration* we learn that M. Wiener had in July reached Archedona, in his exploration of the Napo, one of the great tributaries of the Amazon; unless he meets with disaster, we may expect to hear of him by and by from Pará.

THE *Mittheilungen* of the German African Society, of which six parts are published, contains much very valuable information on recent exploration in Africa by German explorers. We have details of the progress of Herr Schutt's expedition in the Loanda region, of Rohlfs' attempt to push southwards from Tunis, of Dr. Buchner to Muata Janvo's kingdom, of Dr. O. Lenz's determined and so far successful attempt to push southwards through Morocco to Timbuctoo and beyond. We have, besides, records of the doings of the International African Association, and of the various other societies for the exploration of Africa throughout the world. In the double number, 4 and 5, Dr. Reichenau gives a detailed list of the collection of birds sent home from Malanga in Angola by Herr Schütt.

A TELEGRAM from New York, October 5, states that the commander of the United States steamer *Alert* reports the discovery of a submarine volcano near San Alessandro, an island in the Pacific.

THE eruption of the volcano Fuego in Guatemala, to which we referred some weeks ago, ceased almost suddenly in the second half of the month of July. M. de Thiersant, French representative in Guatemala, writes to *La Nature* that another volcano of the same country, Pacaya, seems inclined in its turn to resume activity. At Amatitlan, a small town on the slope of the mountain, subterranean noises succeeded each other almost constantly on July 28.

INTELLIGENCE received at Lloyd's from Christiania, dated October 1, states that the *Neptune* steamer, Capt. Rasmussen, which arrived at Vardo, previous to September 25, from the Obi, reports that on September 19, in Jugor Straits, she fell in with the *Siberiakoff's* expedition proceeding eastward.

THERE is a useful article in the last number of *La Nature* on French Guiana and its forest produce, by Dr. J. Harmand.

SCIENCE AND CULTURE[1].

SIX years ago, as some of my present hearers may remember, I had the privilege of addressing a large assemblage of the inhabitants of this city, who had gathered together to do honour to the memory of their famous townsman, Joseph Priestley; and, if any satisfaction attaches to posthumous glory, we may hope that the manes of the burnt-out philosopher were then finally appeased.

No man, however, who is endowed with a fair share of common sense and not more than a fair share of vanity, will identify either contemporary or posthumous fame with the highest good; and Priestley's life leaves no doubt that he, at any rate, set a much higher value upon the advancement of knowledge and the promotion of that freedom of thought which is at once the cause and the consequence of intellectual progress.

Hence I am disposed to think that, if Priestley could be amongst us to-day, the occasion of our meeting would afford him even greater pleasure than the proceedings which celebrated the centenary of his chief discovery. The kindly heart would be moved, the high sense of social duty would be satisfied, by the spectacle of well-earned wealth, neither squandered in tawdry luxury and vain-glorious show; nor scattered with the careless charity which blesses neither him that gives nor him that takes; but expended in the execution of a well-considered plan for the aid of present and future generations of those who are willing to help themselves.

We shall all be of one mind thus far. But it is needful to share Priestley's keen interest in physical science; to have learned, as he had learned, the value of scientific training in fields of inquiry apparently far remote from physical science; to appreciate, as he would have appreciated, the value of the noble gift which Sir Josiah Mason has bestowed upon the inhabitants of the Midland district.

For us children of the nineteenth century, however, the establishment of a college under the conditions of Sir Josiah Mason's Trust, has a significance apart from any which it could have possessed a hundred years ago. It appears to be an indication that we are reaching the crisis of the battle, or rather of the long series of battles, which have been fought over education in a campaign which began long before Priestley's time, and will probably not be finished just yet.

In the last century, the combatants were the champions of ancient literature, on the one side, and those of modern literature on the other; but, some thirty years ago, the contest became complicated by the appearance of a third army, ranged round the banner of Physical Science.

I am not aware that any one has authority to speak in the name of this new host. For it must be admitted to be somewhat of a guerilla force, composed largely of irregulars, each of whom fights pretty much for his own hand. But the impressions of a full private, who has seen a good deal of service in the ranks, respecting the present position of affairs and the conditions of a permanent peace, may not be devoid of interest; and I do not know that I could make a better use of the present opportunity than by laying them before you.

From the time that the first suggestion to introduce physical science into ordinary education was timidly whispered, until now, the advocates of scientific education have met with opposition of two kinds. On the one hand they have been pooh-poohed by the men of business who pride themselves on being the representatives of practicality; while on the other hand they have been excommunicated by the classical scholars, in their capacity of Levites in charge of the ark of culture and monopolists of liberal education.

The practical men believed that the idol whom they worship—rule of thumb—has been the source of the past prosperity, and will suffice for the future welfare of the arts and manufactures. They were of opinion that science is speculative rubbish; that theory and practice have nothing to do with one another; and that the scientific habit of mind is an impediment rather than an aid in the conduct of ordinary affairs.

I have used the past tense in speaking of the practical men—for although they were very formidable thirty years ago, I am not sure that the pure species has not been extirpated. In fact, so far as mere argument goes, they have been subjected to such a *feu d'enfer* that it is a miracle if any have escaped. But I have remarked that your typical practical man has an unexpected resemblance to one of Milton's angels. His spiritual wounds, such as are inflicted by logical weapons, may be as deep as a well and as wide as a church door, but beyond shedding a few drops of ichor, celestial or otherwise, he is no whit the worse. So if any of these opponents be left I will not waste time in vain repetition of the demonstrative evidence of the practical value of science; but, knowing that a parable will sometimes penetrate where syllogisms fail to effect an entrance, I will offer a story for their consideration.

Once upon a time, a boy, with nothing to depend upon but his own vigorous nature, was thrown into the thick of the struggle for existence in the midst of a great manufacturing population. He seems to have had a hard fight, inasmuch as, by the time he was thirty years of age, his total disposable funds amounted to twenty pounds. Nevertheless middle life found him giving proof of his comprehension of the practical problems he had been roughly called upon to solve, by a career of remarkable prosperity.

Finally, having reached old age with its well-earned surroundings of "honour, troops of friends," the hero of my story bethought himself of those who were making a like start in life, and how he could stretch out a helping hand to them.

After long and anxious reflection this successful practical man of business could devise nothing better than to provide them with the means of obtaining "sound, extensive, and practical scientific knowledge." And he devoted *a large part of his* wealth and five years of incessant work to this end.

I need not point the moral of a tale which, as the solid and spacious fabric of the Scientific College assures us, is no fable, nor can anything which I could say intensify the force of this practical answer to practical objections.

We may take it for granted then, that, in the opinion of those best qualified to judge, the diffusion of thorough scientific education is an absolutely essential condition of industrial progress, and that the College opened to-day will confer an inestimable boon upon those whose livelihood is to be gained by the practice of the arts and manufactures of the district.

The only question worth discussion is, whether the conditions, under which the work of the College is to be carried out, are such as to give it the best possible chance of *achieving permanent* success.

Sir Josiah Mason, without doubt most wisely, has left very large freedom of action to the trustees, to whom he proposes ultimately to commit the administration of the College, so that they may be able to adjust its arrangements in accordance with the changing conditions of the future. But, with respect to three points, he has laid most explicit injunctions upon both administrators and teachers.

Party politics are forbidden to enter into the minds of either, so far as the work of the College is concerned; theology is as sternly banished from its precincts; and finally, it is especially declared that the College shall make no provision for "mere literary instruction and education."

It does not concern me at present to dwell upon the first two injunctions any longer than may be needful to express my full conviction of their wisdom. But the third prohibition brings us face to face with those other opponents of scientific education, who are by no means in the moribund condition of the practical man, but alive, alert, and formidable.

It is not impossible that we shall hear this express exclusion of "literary instruction and education" from a College which, nevertheless, professes to give a high and efficient education, sharply criticised. Certainly the time was that the Levites of culture would have sounded their trumpets against its walls as against an educational Jericho.

How often have we not been told that the study of physical science is incompetent to confer culture; that it touches none of the higher problems of life; and, what is worse, that the continual devotion to scientific studies tends to generate a narrow and bigoted belief in the applicability of scientific methods to the search after truth of all kinds. How frequently one has reason to observe that no reply to a troublesome argument tells so well as calling its author a "mere scientific specialist." And, as I am afraid it is not permissible to speak of this form of opposition to scientific education in the past tense; may we not expect to be told that this, not only omission, but prohibition of "mere literary instruction and education" is a patent example of scientific narrow-mindedness?

---

[1] An Address delivered on the occasion of the opening of Sir Josiah Mason's Science College, at Birmingham, on October 1, by Thomas H. Huxley, F.R.S.

I am not acquainted with Sir Josiah Mason's reasons for the action which he has taken; but if, as I apprehend is the case, he refers to the ordinary classical course of our schools and universities, by the name of "mere literary instruction and education," I venture to offer sundry reasons of my own in support of that action.

For I hold very strongly by two convictions—The first is, that neither the discipline nor the subject-matter of classical education is of such direct value to the student of physical science as to justify the expenditure of valuable time upon either; and the second is, that for the purpose of attaining real culture, an exclusively scientific education is at least as effectual as an exclusively literary education.

I need hardly point out to you that these opinions, especially the latter, are diametrically opposed to those of the great majority of educated Englishmen, influenced as they are by school and university traditions. In their belief culture is obtainable only by a liberal education, and a liberal education is synonymous not merely with education and instruction in literature, but in one particular form of literature, namely, that of Greek and Roman antiquity. They hold that the man who has learned Latin and Greek, however little, is educated; while he who is versed in other branches of knowledge, however deeply, is a more or less respectable specialist, not admissible into the cultured caste. The stamp of the educated man, the University degree, is not for him.

I am too well acquainted with the generous catholicity of spirit, the true sympathy with scientific thought, which pervades the writings of our chief apostle of culture to identify him with these opinions; and yet one may cull from one and another of those epistles to the Philistines, which so much delight all who do not answer to that name, sentences which lend them some support.

Mr. Arnold tells us that the meaning of culture is "to know the best that has been thought and said in the world." It is the criticism of life contained in literature. That criticism regards "Europe as being for intellectual and spiritual purposes one great confederation, bound to a joint action and working to a common result; and whose members have for their common outfit a knowledge of Greek, Roman, and Eastern antiquity, and of one another. Special local and temporary advantages being put out of account, that modern nation will in the intellectual and spiritual sphere make most progress which most thoroughly carries out this programme. And what is that but saying that we too, all of us as individuals, the more thoroughly we carry it out shall make the more progress!"

We have here to deal with two distinct propositions. The first, that a criticism of life is the essence of culture; the second, that literature contains the materials which suffice for the construction of such a criticism.

I think that we must all assent to the first proposition. For culture certainly means something quite different from learning or technical skill. It implies the possession of an ideal, and the habit of critically estimating the value of things by comparison with a theoretic standard. Perfect culture should supply a complete theory of life, based upon a clear knowledge alike of its possibilities and of its limitations.

But we may agree to all this, and yet strongly dissent from the assumption that literature alone is competent to supply this knowledge. After having learnt all that Greek, Roman, and Eastern antiquity have thought and said, and all that modern literatures have to tell us, it is not self-evident that we have laid a sufficiently broad and deep foundation for that criticism of life which constitutes culture.

Indeed, to any one acquainted with the scope of physical science, it is not at all evident. Considering progress only in the "intellectual and spiritual sphere," I find myself wholly unable to admit that either nations or individuals will really advance if their common outfit draws nothing from the stores of physical science. I should say that an army without weapons of precision and with no particular base of operations might more hopefully enter upon a campaign on the Rhine than a man, devoid of a knowledge of what physical science has done in the last century, upon a criticism of life.

When a biologist meets with an anomaly, he instinctively turns to the study of development to clear it up. The rationale of contradictory opinions may with equal confidence be sought in history.

It is, happily, no new thing that Englishmen should employ their wealth in building and endowing institutions for educational purposes. But, five or six hundred years ago, deeds of foundation expressed or implied conditions as nearly as possible contrary to those which have been thought expedient by Sir Josiah Mason. That is to say, physical science was practically ignored, while a certain literary training was enjoined as a means to the acquirement of knowledge which was essentially theological.

The reason of this singular contradiction between the actions of men alike animated by a strong and disinterested desire to promote the welfare of their fellows, is easily discovered.

At that time, in fact, if any one desired knowledge beyond such as could be obtained by his own observation, or by common conversation, his first necessity was to learn the Latin language, inasmuch as all the higher knowledge of the western world was contained in works written in that language. Hence Latin grammar, with logic and rhetoric, studied through Latin, were the fundamentals of education. With respect to the substance of the knowledge imparted through this channel, the Jewish and Christian Scriptures, as interpreted and supplemented by the Romish church, were held to contain a complete and infallibly true body of information.

Theological dicta were, to the thinkers of those days, that which the axioms and definitions of Euclid are to the geometers of these. The business of the philosophers of the middle ages was to deduce from the data furnished by the theologians, conclusions in accordance with ecclesiastical decrees. They were allowed the high privilege of showing, by logical process, how and why that which the Church said was true, must be true. And if their demonstrations fell short of or exceeded this limit, the Church was maternally ready to check their aberrations, if need be, by the help of the secular arm.

Between the two, our ancestors were furnished with a compact and complete criticism of life.

They were told how the world began and how it would end; they learned that all material existence was but a base and insignificant blot upon the fair face of the spiritual world, and that nature was, to all intents and purposes, the playground of the devil; they learned that the earth is the centre of the visible universe, and that man is the cynosure of things terrestrial; and more especially was it inculcated that the course of nature had no fixed order, but that it could be, and constantly was, altered by the agency of innumerable spiritual beings, good and bad, according as they were moved by the deeds and prayers of men. The sum and substance of the whole doctrine was to produce the conviction that the only thing really worth knowing in this world was how to secure that place in a better which, under certain conditions, the Church promised.

Our ancestors had a living belief in this theory of life, and acted upon it in their dealings with education, as in all other matters. Culture meant saintliness—after the fashion of the saints of those days; the education that led to it was, of necessity, theological; and the way to theology lay through Latin.

That the study of nature—further than was requisite for the satisfaction of every-day wants—should have any bearing on human life was far from the thoughts of men thus trained. Indeed, as nature had been cursed for man's sake, it was an obvious conclusion that those who meddled with nature were likely to come into pretty close contact with Satan. And if any born scientific investigator followed his instincts he might safely reckon upon earning the reputation, and probably upon suffering the fate, of a sorcerer.

Had the western world been left to itself in Chinese isolation, there is no saying how long this state of things might have endured. But, happily, it was not left to itself. Even earlier than the thirteenth century, the development of Moorish civilisation in Spain and the great movement of the Crusades had introduced the leaven which, from that day to this, has never ceased to work. At first, through the intermediation of Arabic translations, afterwards, by the study of the originals, the western nations of Europe became acquainted with the writings of the ancient philosophers and poets, and, in time, with the whole of the vast literature of antiquity.

Whatever there was of high intellectual aspiration or dominant capacity in Italy, France, Germany, and England, spent itself for centuries in taking possession of the rich inheritance left by the dead civilisations of Greece and Rome. Marvellously aided by the invention of printing, classical learning spread and flourished. Those who possessed it prided themselves on having attained the highest culture then within the reach of mankind.

And justly. For, saving Dante on his solitary pinnacle, there was no figure in modern literature at the time of the Renascence to compare with the men of antiquity; there was no art to compete with their sculpture; there was no physical science but that which Greece had created. Above all, there was no other example of perfect intellectual freedom—of the unhesitating acceptance of reason as the sole guide to truth and arbiter of conduct.

The new learning necessarily soon exerted a profound influence upon education. The language of the monks and schoolmen seemed little better than gibberish to scholars fresh from Virgil and Cicero, and the study of Latin was placed upon a new foundation. Moreover, Latin itself ceased to afford the sole key to knowledge. The student who sought the highest thought of antiquity, found only a second-hand reflection of it in Roman literature, and turned his face to the full light of the Greeks. And after a battle, not altogether dissimilar to that which is at present being fought over the teaching of physical science, the study of Greek was recognised as an essential element of all higher education.

Thus the Humanists, as they were called, won the day; and the great reform which they effected was of incalculable service to mankind. But the Nemesis of all reformers is finality; and the reformers of education, like those of religion, fell into the profound but common error of mistaking the beginning for the end of the work of reformation.

The representatives of the Humanists, in the nineteenth century, take their stand upon classical education as the sole avenue to culture, as firmly as if we were still in the age of Renascence. Yet surely the present intellectual relations of the modern and the ancient worlds are profoundly different from those which obtained three centuries ago. Leaving aside the existence of a great and characteristically modern literature, of modern painting, and, especially, of modern music, there is one feature of the present state of the civilised world which separates it more widely from the Renascence, than the Renascence was separated from the middle ages.

This distinctive character of our own times lies in the vast and constantly increasing part which is played by Natural Knowledge. Not only is our daily life shaped by it, not only does the prosperity of millions of men depend upon it, but our whole theory of life has long been influenced, consciously or unconsciously, by the general conceptions of the universe, which have been forced upon us by physical science.

In fact, the most elementary acquaintance with the results of scientific investigation shows us that they offer a broad and striking contradiction to the opinions so implicitly credited and taught in the middle ages.

The notions of the beginning and the end of the world entertained by our forefathers are no longer credible. It is very certain that the earth is not the chief body in the material universe, and that the world is not subordinated to man's use. It is even more certain that nature is the expression of a definite order with which nothing interferes, and that the chief business of mankind is to learn that order and govern themselves accordingly. Moreover this scientific "criticism of life" presents itself to us with different credentials from any other. It appeals not to authority, nor to what anybody may have thought or said, but to nature. It admits that all our interpretations of natural fact are more or less imperfect and symbolic, and bids the learner seek for truth not among words but among things. It warns us that the assertion which outstrips evidence is not only a blunder but a crime.

The purely classical education advocated by the representatives of the Humanists in our day, gives no inkling of all this. A man may be a better scholar than Erasmus, and know no more of the chief causes of the present intellectual fermentation than Erasmus did. Scholarly and pious persons, worthy of all respect, favour us with allocutions upon the sadness of the antagonism of Science to their mediæval way of thinking, which betray an ignorance of the first principles of scientific investigation, an incapacity for understanding what a man of science means by veracity, and an unconsciousness of the weight of established scientific truths, which is almost comical.

There is no great force in the *tu quoque* argument, or else the advocates of scientific education might fairly enough retort upon the modern Humanists that they may be learned specialists, but that they possess no such sound foundation for a criticism of life as deserves the name of culture. And, indeed, if we were disposed to be cruel we might urge that the Humanists have brought this reproach upon themselves, not because they are too full of the spirit of the ancient Greek, but because they lack it.

The period of the Renascence is commonly called that of the "Revival of Letters," as if the influences then brought to bear upon the mind of western Europe had been wholly exhausted in the field of literature. I think it is very commonly forgotten that the revival of science, effected by the same agency, although less conspicuous, was not less momentous.

In fact, the few and scattered students of nature of that day picked up the clue to her secrets exactly as it fell from the hands of the Greeks a thousand years before. The foundations of mathematics were so well laid by them that our children learn their geometry from a book written for the schools of Alexandria two thousand years ago. Modern astronomy is the natural continuation and development of the work of Hipparchus and of Ptolemy; modern physics of that of Democritus and Archimedes; it was long before modern biological science outgrew the knowledge bequeathed to us by Aristotle, Theophrastus, and Galen.

We cannot know all the best thoughts and sayings of the Greeks unless we know what they thought about natural phenomena. We cannot fully apprehend their criticism of life unless we understand the extent to which that criticism was affected by scientific conceptions. We falsely pretend to be the inheritors of their culture, unless we are penetrated, as the best minds among them were, with an unhesitating faith that the free employment of reason, in accordance with scientific method, is the sole guide to truth.

Thus I venture to think that the pretensions of our modern Humanists to the possession of the monopoly of culture and to the exclusive inheritance of the spirit of antiquity must be abated, if not abandoned. But I should be very sorry that anything I have said should be taken to imply a desire on my part to depreciate the value of classical education, as it might be and as it sometimes is. The native capacities of mankind vary no less than their opportunities; and while culture is one, the road by which one man may best reach it is widely different from that which is most advantageous to another. Again, while scientific education is yet inchoate and tentative, classical education is thoroughly well organised upon the practical experience of generations of teachers. So that, given ample time for learning and destination for ordinary life, or for a literary career, I do not think that a young Englishman in search of culture can do better than follow the course usually marked out for him, supplementing its deficiencies by his own efforts.

But for those who mean to make science their serious occupation; or who intend to follow the profession of medicine; or who have to enter early upon the business of life; for all these, in my opinion, classical education is a mistake; and it is for that reason that I am glad to see "mere literary education and instruction" shut out from the curriculum of Sir Josiah Mason's College, seeing that its inclusion would probably lead to the introduction of the ordinary smattering of Latin and Greek.

Nevertheless, I am the last person to question the importance of genuine literary education, or to suppose that intellectual culture can be complete without it. An exclusively scientific training will bring about a mental twist as surely as an exclusively literary training. The value of the cargo does not compensate for a ship's being out of trim; and I should be very sorry to think that the Scientific College would turn out none but lop-sided men.

There is no need however that such a catastrophe should happen. Instruction in English, French, and German is provided, and thus the three greatest literatures of the modern world are made accessible to the student.

French and German, and especially the latter language, are absolutely indispensable to those who desire full knowledge in any department of science. But even supposing that the knowledge of these languages acquired is not more than sufficient for purely scientific purposes, every Englishman has, in his native tongue, an almost perfect instrument of literary expression; and, in his own literature, models of every kind of literary excellence. If an Englishman cannot get literary culture out of his Bible, his Shakspere, his Milton, neither, in my belief, will the profoundest study of Homer and Sophocles, Virgil and Horace, give it to him.

Thus, since the constitution of the College makes sufficient provision for literary as well as for scientific education, and since artistic instruction is also contemplated, it seems to me that a fairly complete culture is offered to all who are willing to take advantage of it.

But I am not sure that at this point the "practical" man, scotched but not slain, may ask what all this talk about culture has to do with an Institution, the object of which is defined to be "to promote the prosperity of the manufactures and the industry of the country." He may suggest that what is wanted for this end is not culture, nor even a purely scientific discipline, but simply a knowledge of applied science.

I often wish that this phrase, "applied science," had never been invented. For it suggests that there is a sort of scientific knowledge of direct practical use, which can be studied apart from another sort of scientific knowledge, which is of no practical utility, and which is termed "pure science." But there is no more complete fallacy than this. What people call applied science is nothing but the application of pure science to particular classes of problems. It consists of deductions from those general principles, established by reasoning and observation, which constitute pure science. No one can safely make these deductions until he has a firm grasp of the principles; and he can obtain that grasp only by personal experience of the processes of observation and of reasoning on which they are founded.

Almost all the processes employed in the arts and manufactures fall within the range either of physics or of chemistry. In order to improve them, one must thoroughly understand them; and no one has a chance of really understanding them who has not obtained that mastery of principles and that habit of dealing with facts which is given by long-continued and well-directed purely scientific training in the physical and the chemical laboratory. So that there really is no question as to the necessity of purely scientific discipline, even if the work of the College were limited by the narrowest interpretation of its stated aims.

And, as to the desirableness of a wider culture than that yielded by science alone, it is to be recollected that the improvement of manufacturing processes is only one of the conditions which contribute to the prosperity of industry. Industry is a means and not an end; and mankind work only to get something which they want. What that something is depends partly on their innate, and partly on their acquired, desires.

If the wealth resulting from prosperous industry is to be spent upon the gratification of unworthy desires; if the increasing perfection of manufacturing processes is to be accompanied by an increasing debasement of those who carry them on, I do not see the good of industry and prosperity.

Now it is perfectly true that men's views of what is desirable depend upon their characters; and that the innate proclivities to which we give that name are not touched by any amount of instruction. But it does not follow that even mere intellectual education may not, to an indefinite extent, modify the practical manifestation of the characters of men in their actions, by supplying them with motives unknown to the ignorant. A pleasure-loving character will have pleasure of some sort; but, if you give him the choice, he may prefer pleasures which do not degrade him to those which do. And this choice is offered to every man, who possesses in literary or artistic culture a never-failing source of pleasures, which are neither withered by age, nor staled by custom, nor embittered in the recollection by the pangs of self-reproach.

If the Institution opened to-day fulfils the intention of its founder, the picked intelligences among all classes of the population of this district will pass through it. No child born in Birmingham, henceforward, if he have the capacity to profit by the opportunities offered to him first in the primary and other schools, and afterwards in the Scientific College, need fail to obtain, not merely the instruction, but the culture most appropriate to the conditions of his life.

Within these walls, the future employer and the future artisan may sojourn together for a while, and carry through all their lives the stamp of the influences then brought to bear upon them. Hence, it is not beside the mark to remind you that the prosperity of industry depends not merely upon the improvement of manufacturing processes, not merely upon the ennobling of the individual character, but upon a third condition, namely, a clear understanding of the conditions of social life on the part of both the capitalist and the operative, and their agreement upon common principles of social action. They must learn that social phenomena are as much the expression of natural laws as any others; that no social arrangements can be permanent unless they harmonise with the requirements of social statics and dynamics; and that, in the nature of things, there is an arbiter whose decisions execute themselves.

But this knowledge is only to be obtained by the application of the methods of investigation adopted in physical researches to the investigation of the phenomena of society. Hence, I confess, I should like to see one addition made to the excellent scheme of education propounded for the College, in the shape of provision for the teaching of Sociology. For though we are all agreed that party politics are to have no place in the instruction of the College; yet in this country, practically governed as it is now by universal suffrage, every man who does his duty must exercise political functions. And if the evils which are inseparable from the good of political liberty are to be checked, if the perpetual oscillation of nations between anarchy and despotism is to be replaced by the steady march of self-restraining freedom; it will be because men will gradually bring themselves to deal with political, as they now deal with scientific questions; to be as ashamed of undue haste and partisan prejudice in the one case as in the other; and to believe that the machinery of society is at least as delicate as that of a spinning-jenny, and not more likely to be improved by the meddling of those who have not taken the trouble to master the principles of its action.

In conclusion, I am sure that I make myself the mouthpiece of all present in offering to the venerable Founder of the Institution, which now commences its beneficent career, our congratulations on the completion of his work; and in expressing the conviction, that the remotest posterity will point to it as a crucial instance of the wisdom which natural piety leads all men to ascribe to their ancestors.

ON A SEPTUM PERMEABLE TO WATER, AND IMPERMEABLE TO AIR, WITH APPLICATION TO A NAVIGATIONAL DEPTH GAUGE[1]

A SMALL quantity of water in a capillary tube, with both ends in air acts as a perfectly air-tight plug against difference of pressure of air at its two ends, equal to the hydrostatic pressure corresponding to the height at which water stands in the same capillary tube when it is held upright, with one end under water and the other in air. And if the same capillary tube be held completely under water, it is perfectly permeable to the water, opposing no resistance except that due to viscidity, and permitting a current of water to flow through it with any difference of pressure at its two ends, however small. In passing it may be remarked that the same capillary tube is, when not plugged by liquid, perfectly permeable to air.

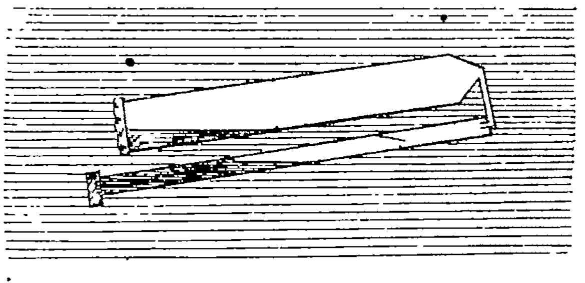
A plate of glass, or other solid, capable of being perfectly wet by water, with a hole bored through it, acts similarly in letting air pass freely through it when there is no water in the hole; and letting water pass freely through it when it is held under water; and resisting a difference of air-pressures at the two sides of it when the hole is plugged by water. The difference of air-pressures on the two sides which it resists is equal to the hydrostatic pressure corresponding to the rise of water in a capillary tube of the same diameter as the narrowest part of the hole. Thus a metal plate with a great many fine perforations, like a very fine rose for a watering-can for flowers, fulfils the conditions stated in the title to this communication. So does very fine wire cloth. The finer the holes, the greater is the difference of air-pressures balanced, when they are plugged with water. The shorter the length of each hole the less it resists the passage of water when completely submerged; and the greater the number of holes, the less is the whole resistance to the permeation of water through the membrane.

---

[1] Paper read at the British Association by Sir William Thomson.

Hence, clearly, the object indicated in the title is more perfectly attained, the thinner the plate and the smaller and more numerous the holes. Very fine wire cloth would answer the purpose better than any metal plate with holes drilled through it; and very fine closely-woven cotton cloth, or cambric, answers better than the finest wire cloth. The impenetrability of wet cloth to air is well known to laundresses, and to every naturalist who has ever chanced to watch their operations. The quality of dry cloth to let air through with considerable freedom, and wet cloth to resist it, is well known to sailors, wet sails being sensibly more effective than dry sails (and particularly so in the case of old sails, and of sails of thin and light material).

An illustration was shown to the meeting by taking an Argand lamp-funnel, with a piece of very fine closely-woven cotton cloth tied over one end of it. When the cloth was dry, and the other end dipped under water, the water rose with perfect freedom inside, showing exceedingly little resistance to the passage of air through the dry cloth. When it was inverted, and the end guarded by the cloth was held under water, the water rose with very great freedom, showing exceedingly little resistance to the permeation of water through the cloth. The cloth being now wet, and the glass once more held with its other end under water, the cloth now seemed perfectly air-tight, even when pressed with air-pressure corresponding to nine inches of water, by forcing down the funnel, which was about nine inches long, till the upper end was nearly submerged. When it was wholly submerged, so that there was air on one side and water on the other, the resistance to permeation of air was as decided as it was when the cloth, very perfectly wet, had air on each side of it.



Water indicated by horizontal shading; Air by white paper.

Once more, putting the cloth end under water; holding the tube nearly horizontal, and blowing by the mouth applied to the other end:—the water which had risen into the funnel before the mouth was applied, was expelled. After that no air escaped until the air-pressure within exceeded the water pressure on the outside of the cloth by the equivalent of a little more than nine inches of water; and when blown with a pressure just a very little more than that which sufficed to produce a bubble from any part of the cloth, bubbles escaped in a copious torrent from the whole area of the cloth.

The accompanying sketch represents the application to the Navigational Depth Gauge. The wider of the two communicating tubes, shown uppermost in the sketch, has its open mouth guarded by very fine cotton cloth tied across it. The tube shown lower in the diagram is closed for the time of use by a stopper at its lower end. A certain quantity of water (which had been forced into it during the descent of the gauge to the bottom of the sea) is retained in it while the gauge is being towed up to the surface in some such oblique position as that shown in the sketch. While this is being done the water in the wide tube is expelled by the expanding air. The object of the cloth guard is to secure that this water is expelled to the last drop before any air escapes; and that afterwards, while the gauge is being towed wildly along the surface from wave to wave by a steamer running at fourteen or sixteen knots, not a drop of water shall re-enter the instrument.

ON THE CLASSIFICATION OF BIRDS[1]

ABOUT twelve years ago Prof. Huxley had taken up the subject of the classification of birds in his usual zealous and original way, and from quite a new point of view. Prof. Huxley, treating birds mainly from their bones and as if they were extinct animals of which these parts of their structure only were known, had proposed an entirely new plan of arrangement, based mainly upon the characteristic variations of the palatal bones, which had passed almost unnoticed by previous writers. The author, who had long been dissatisfied with the Cuvierian system, which with certain modifications he had employed up to 1872, had in that year been constrained to consider the whole subject in order to decide what arrangements should be adopted in the "Nomenclator Avium Americanarum" (a joint work by Mr. O. Salon and himself), then ready for publication. Prof. Huxley had commenced his system with the lowest and most reptilian birds, and had ended it with the highest and most specialised. But it seemed to the author that by exactly reversing this arrangement he would obtain a scheme which would not very far deviate from that which he had previously employed for the first three orders, and would offer many improvements on the Cuvierian system in the remaining ones. Such a scheme had accordingly been promulgated in the Introduction to the "Nomenclator" and followed in that work. In the various subsequently issued editions of the "List of Vertebrated Animals in the Zoological Society's Gardens" a nearly similar arrangement had been followed. A certain amount of adhesion having been secured to this system, the author had been recently induced to devote some labour to its improvement and development. As now elaborated it did not profess to be in any respects original, except as regarded certain small details on points to which he had devoted special attention. The arrangement was in fact simply that of Huxley reversed, with slight modifications consequent upon the recent researches of Parker and Garrod on the anatomy and osteology of little known forms.

The author then proceeded to explain further the "Systema Avium" thus advocated, as shown in the subjoined table, in which the approximate number of known species was added after each Order.

ORDERS OF EXISTING BIRDS

SUBCLASS CARINATÆ (10,121 SPECIES)

		Species.			Species.
I.	Passeres	5,700	XIII.	Gallinæ	320
II.	Picariæ	1,600	XIV.	Opisthocomi ...	1
III.	Psittaci	400	XV.	Hemipodii ...	24
IV.	Striges	180	XVI.	Fulicariæ ...	150
V.	Accipitres... ...	330	XVII.	Alectorides ...	60
VI.	Steganopodes ...	60	XVIII.	Limicolæ ...	250
VII.	Herodiones ...	130	XIX.	Gaviæ	130
VIII.	Odontoglossæ ...	8	XX.	Tubinares ...	100
IX.	Palamedeæ ...	3	XXI.	Pygopodes ...	65
X.	Anseres	180	XXII.	Impennes ...	20
XI.	Columbæ	355	XXIII.	Crypturi	40
XII.	Pterocletes ...	15			

SUBCLASS RATITÆ (18 SPECIES)

XXIV.	Apteryges	4	XXVI.	Struthiones ...	4
XXV.	Casuarii	10			

In submitting this arrangement, as one which on the whole he was disposed to regard as the best to be adopted after many years' study of the Class of Birds, the author observed that it should be recollected that, although a linear system is an absolute necessity for practical use, it could never be a perfectly natural one. It would always be found that certain groups were nearly equally related to others in different places in the linear series, and that it was a matter of difficulty to decide with which of the allied forms they were best located. But, a linear arrangement being an absolute necessity, it became our duty to make it as natural as possible.

THE GREEN COLOUR OF OYSTERS

IN NATURE, vol. xvi. p. 397, mention was made of the fact that the green colour observed in oysters in certain localities is caused by a variety of navicula, to which the name *Navicula ostrearia* has been given. Further particulars of experiments made by M. Puységur, at Sissable, are not without interest.[1]

"The green slime was collected by lightly scraping the margin of one of the 'clears' with a spoon, and was put in flasks, shaken for a moment and then allowed to settle, so as to get rid of the mud, some admixture of which is inevitable. The coloured fluid, containing little or nothing besides diatoms, was then poured off into other flasks. Care and some little dexterity are requisite, as if there is too much silt or too large a quantity of water, which is generally the case when the task is intrusted to a subordinate, it is sometimes next to impossible to concentrate the fluid enough to show the results with the desired plainness.

---

[1] Abstract of a paper read at the British Association by P. L. Sclater, M.A., Ph.D., F.R.S.

[1] *Revue maritime et coloniale*, February, 1880.

"Returning home, we poured the fluid into soup-plates set on a table before a window. The diatoms speedily settled on the sides and bottoms of the plates, coating them with a green slime, the thickness and tint of which varied with the proportion of diatoms present. In each plate, according to its size, we put three to six perfectly white oysters which had never been in the 'clears,' and the shells of which had previously been washed and brushed clean. In similar plates like numbers of the same oysters were laid in ordinary sea-water. Twenty-six hours after the commencement of the experiment the oysters in the water charged with diatoms had all acquired a marked greenish hue; the other oysters remained unaltered. The experiment was repeated many times with identically the same results. The green colour in the oysters was found to be more decided in proportion as the water was more highly charged with diatoms. In the course of the experiments the shell of one of the oysters was perforated, so as to lay bare the mantle. After the oyster had turned green, it was laid in ordinary sea-water for a few days, when the greenness disappeared altogether. It reappeared when the oyster was replaced in fresh water containing *Navicula ostrearia*. The experiment was repeated, with like results, in the laboratory of M. Decaisne, Jardin des Plantes, Paris, to which a supply of white oysters and sealed flasks of the water containing the diatoms was forwarded.

"In the course of the experiments it was observed that by the opening and closing of their valves the oysters induced currents in the water, by means of which they drew towards them and surrounded themselves with the particles of matter suspended therein. The existence and direction of these currents were shown by the disappearance of the slime and the consequent laying bare of the sides and bottoms of the plates, the diatoms remaining only at points out of reach of the currents.

"Directed towards the buccal aperture by the ciliæ with which the branchiæ are provided, the naviculæ enter the stomach of the mollusc, and there part with their nutritive constituents. The yellow chlorophyll is digested and decomposed; the soluble colouring matter passes direct into the blood, to which it imparts its colour. Thus it happens that the most vesicular portions of the structure, as the branchiæ, are the most highly coloured.

"Examination of the digestive tubes of the oysters experimented upon proved the fact of the absorption of the diatoms. The stomachs, intestines, and exuviæ were strewed with carapaces of naviculæ. The carapaces, being siliceous, are not affected by the digestive juices, and it would seem extraordinary that with so tenacious a covering their contents should be evolved, were it not for the knowledge of the fact that the covering is not continuous, the line of suture separating the valves composing the frustule being scarcely silicified at all."

It would therefore appear to be established beyond dispute that the green hue in oysters is due exclusively to their absorption of certain naviculæ contained in the circumambient water. The facts are in perfect keeping with the observations of growers that heavy rains (which increase the supply of fresh water) cause the disappearance of the green from the "clears," while, on the other hand, dry north-east gales, which greatly increase the saturation of the water, bring it, as it is called, "into condition."

Two points of special interest in connection with the subject remain for future investigation. These are:—

1. Does the navicula in question remain all the year in the waters where it is found in winter?

2. Is the coloration of the beds accidental or temporary?—in other words, does this alga disappear from the reservoirs when the water changes its colour, or does it become itself discoloured for a time?

H. M. C.

MODERN ENTOMOLOGY[1]

IT is the good fortune of your president on this occasion to welcome you to his native heath, where our favourite science has been longer, more uninterruptedly, and perhaps more zealously cultivated than anywhere else in the New World. Here, in the last century, Peck studied the Canker-worm and the Slug-worm of the Cherry, and in late years *Rhynchænus*, *Stenocorus*, and *Cossus*—all highly destructive insects. Here lived Harris, who cultivated entomology in its broadest sense, and whose classic treatise was the first important Government publication on injurious insects. Here to-day we have two associations for our work, consisting, it will be confessed, of nearly the same individuals, and not many of them, but meeting frequently—one in Boston, the other in Cambridge. Harvard acknowledges the claims of our study in supporting not only an instructor in entomology at its Agricultural School, but a full Professor of the same in the University at large.

In our own day the spreading territory of the United States, the penetration of its wilds, and the inersection of its whole area by routes of travel, the wider distribution and greatly-increased numbers of local entomologists, as well as the demand for our natural products abroad, have set before *us* temptation to study only new forms and to cultivate descriptive work, to the neglect of the choicer, broader fields of our ever-opening science. It is this danger to which I venture briefly to call your attention to-day, not by way of disparaging the former, but rather in the hope that some of our younger members, who have not yet fallen into the ruts of work, may be induced to turn their attention to some of the more fruitful fields of diligent research.

We should not apply the term descriptive work merely to the study of the external features of insects. The great bulk of what passes for comparative anatomy, physiology, and embryology is purely descriptive, and is only to be awarded a higher grade in a scale of studies than that which deals with the external properties when it requires a better training of the hand and eye to carry it out, and greater patience of investigation. We pass at once to a higher grade of research when we deal with comparisons or processes (which of course involve comparisons). All good descriptive work indeed is also comparative; but at the best it is so only in the narrowest sense, for only intimately allied forms are compared. In descriptive work we deal with simple facts; in comparative work we deal with their collocation. "Facts," said Agassiz one day, "facts are stupid things, until brought in connection with some general law."

It is to this higher plane that concerns itself with general laws that I would urge the young student to bend his steps. The way is hard; but in this lies one of its charms, for labour is its own reward. It is by patient plodding that the goal is reached; every step costs and counts; the ever-broadening field of knowledge exhilarates the spirit and intensifies the ambition; there is no such thing as satiety—study of this sort never palls.

It is hardly necessary to point out that so-called systematic work never reaches this higher grade unless it is monographic; unless it deals in a broad way with the relationship and general affinities of insects. It is not my purpose to call attention here to the needs of science in this department, as they are too patent to escape observation; but if one desires a model upon which to construct such work, one need not look further than the "Revision of the Rhynchophora," by Drs. LeConte and Horn. Rather than linger here we prefer to pass directly to some of the obscurer fields of study.

When we compare the number of insect embryologists in America with that of their European colleagues, the result is somewhat disheartening and discreditable; although perhaps the comparison would be not quite so disproportionate were some of our students to publish their notes. But take all that has been done upon both sides of the water, and what a meagre showing it makes! Of how many families of Coleoptera alone have we the embryonic history of a single species?

In following the post-embryonal history of insects there is work for all. While allied forms have in general a very similar development, there are so many which are unexpectedly found to differ from one another, that every addition to our knowledge of the life histories of insects is a gain, and they are to be praised who give their close attention to this matter. Here is a field any entomologist, even the most unskilled, may cultivate to his own advantage and with the assurance that every new history he works out is a distinct addition to the science. The importance of an accumulation of facts in this field can hardly be over-estimated, and those whose opportunities for field-work are good should especially take this suggestion to heart. Nor, by any means, is the work confined to the mere collection of facts. How to account for this extraordinary diversity of life and habits among insects, and what its meaning may be, is one of the problems of the evolutionist. There are also here some specially curious inquiries, to which Sir John Lubbock and others have recently called attention, and to which Mr. Riley has contributed by his history of *Epicauta* and other *Meloidæ*. I refer to the questions connected with so-called hypermetamorphosis in insects. In these cases there are changes of form during the larval period greater than exist between larva and pupa, or even between larva and imago, in some insects. There are also slighter changes than these which very many larvæ undergo; indeed it may safely be asserted that the newly-hatched and the mature larvæ of all external feeders differ from each other in some important features. The differences are really great (when compared to the differences between genera of the same family at a similar time of life) in all lepidopterous larvæ, as well as in all Orthoptera which have come under my notice. No attempt to co-ordinate these differences, or to study their meanings, or to show the nature of their evident relationship to hypermetamorphosis has ever been attempted.

---

[1] Annual Address before the Entomological Club of the American Association for the Advancement of Science, by the President, Mr. S. H. Scudder, of Cambridge.

Not less inviting is the boundless region of investigation into the habits of insects and their relation to their environment. The impulse given to these studies by the rise of Darwinism, and the sudden and curious importance they have assumed in later investigations into the origin and kinship of insects, need only to be mentioned to be acknowledged at once by all of you. The variation in coloration and form exhibited by the same insect at different seasons or in different stations, "sports," the phenomena of dimorphism, and that world of differences between the sexes, bearing no direct relation to sexuality; mimicry also, phosphorescence and its relations to life, the odours of insects, the relation of anthophilous insects to the colours and fructification of flowers, the modes of communication between members of communities, the range and action of the senses,[1] language, commensalism—these are simply a few topics selected quite at random from hundreds which might be suggested, in each of which new observations and comparative studies are urgently demanded.

The fundamental principles of the morphology of insects were laid down by Savigny in some memorable memoirs more than sixty years ago; the contributions of no single author since that time have added so much to our knowledge, notwithstanding the aid that embryology has been able to bring. Nevertheless there remain many unsolved problems in insect morphology which by their nature are little likely to receive help from this source. Let me mention three:—

The first concerns the structure of the organs of flight. The very nomenclature of the veins shows the disgraceful condition of our philosophy of these parts; the same terminology is not employed in any two of the larger sub-orders of insects; names without number have been proposed, rarely however by any author with a view to their applicability to any group outside that which formed his special study; and a tabular view which should illustrate them all would be a curious sight. A careful study of the main and subordinate veins, their relations to each other, to the different regions of the wing, to the supporting parts of the thorax and to the alar muscles, should be carried through the entire order of insects; by no means, either, neglecting their development in time, and possibly deriving some assistance in working out homologies by the study of their hypodermic development.

The second concerns the mouth parts. The general homologies of these organs were clearly and accurately enough stated by Savigny, though one may perhaps have a right to consider the last word not yet said when one recalls Saussure's recent claim to have found in *Hemimerus* a second labium. What I refer to, however, is another point: it relates to the appendages of the maxillæ and the labium. Considering the labium as a soldered pair of secondary maxillæ, we have at the most, on either pair of maxillæ, three appendages upon either side. These appendages, as you know, are very variously developed in different sub-orders of insects, or even in the same sub-order; and it has at least not been shown, and I question if it can be done, that the parts bearing similar names in different sub-orders are always homologous organs. Here is a study as broad and perhaps as difficult as the last.

The third is the morphological significance of monstrosities, especially of such as are termed monstrosities by excess. The literature of the subject is very scattered, and the material much more extensive than many of you may think. At present this subject is, so to speak, only one of the curiosities of entomology, but we may be confident that it will one day show important relations to the story of life.

After all the labours of Herold, Treviranus, Lyonet, Dufour, and dozens of other such industrious and illustrious workers, is there anything important remaining to be done in the gross anatomy of insects? some of you would perhaps ask. Let the recent work of some of our own number answer, which has shown in the Hemiptera and Lepidoptera the existence of a curious pumping arrangement by which nutritious fluids are forced into the stomach. It is certainly strange that after all that has been said as to the mode in which a butterfly feeds, no one should have dissected a specimen with sufficient care to have seen the pharyngeal sac which Mr. Burgess will soon show us. No! the field is still an open one, as the annual reviews clearly show. The curious results of Flögel's studies of the brain, the oddly-constructed sense-organs found by Graber and Meyer (earlier noticed briefly by Leydig) in the antennæ of Diptera, the important anatomical distinctions discovered by Forel in different groups of ants, the strange modification of the tip of the spiral tongue in *Ophideres*, which Darwin, Brietenbach, and Künckel have discussed, and, above all, the extensive investigations of the nervous system in insects generally which Brandt has recently undertaken, the exquisite memoir of Grenacher on the structure of the compound eye, and the keen researches of Graber in various departments of insect anatomy, show by what has been accomplished how many harvests are still unreaped. The microtome, too, has put a new instrument of precision into the hands of the investigator in the field.

If these few words shall arouse in any one a higher ambition, leading to better work, their aim will have been accomplished.

SCIENTIFIC SERIALS

American Naturalist, August 1880.—D. P. Penhallow, the fabrication of Aino cloth.—H. D. Minot, English birds compared with American.—J. S. Gardner, on the age of the Laramie formation as indicated by its vegetable remains.—J. E. Todd, on the flowering of *Saxifraga sarmentosa*.—Prof. A. N. Prentiss, distribution of obnoxious insects by means of fungoid growths.—Recent literature.—General notes.—Scientific *news*.

September.—J. Walter Fewkes, the Siphonophores:—No. 1, the anatomy and development of Agalma.—Prof. A. N. Prentiss, destruction of obnoxious insects by means of fungoid growths (concluded); the result of these experiments would seem to indicate plainly that yeast cannot be regarded as a reliable remedy against such insects as commonly affect plants cultivated in greenhouses or in windows, but the general question is by no means as yet decided.—O. B. Johnson, birds of the Willamette Valley, Oregon (concluded).—C. O. Whitman, Do flying-fish fly?

Boas, on the heart and arch of the aorta in Ceratodus and Protopterus, with three plates and woodcuts (a memoir both descriptive and critical of the various researches on this subject by Hyrtl, Owen, Peters, Lankester, and Gunther).—G. v. Koch, notes on corals, with a plate.—George Ruge, researches on the process of development of the sternum, and on the sterno-clavicular attachments in man, with three plates.—W. Salensky, contribution to the developmental history of the ear cartilages in mammals, with a plate.

Zeitschrift für wissenschaftliche Zoologie, Bd. xxxiv., Heft. 3, July.—Gustav Häuser, physiological and histological investigations on the organ of smell in insects, three plates (finds in most insects well-marked nerves springing from the cephalic ganglia distributed to the antennæ, where special hypodermic cells receive them; the development and structure of these are beautifully illustrated).—O. Zimmermann, on a peculiar formation in the abdominal vessels in an Ephemeris larva.—Prof. F. E. Schulze, researches on the structure and development of the sponges: No. 9, the Plakinidæ, three plates (three new genera and five new species described).—John Honigschmied, brief notices concerning the distribution of the gustatory papillæ in mammals.—Dr. J. W. Spengel, contribution to a knowledge of the Gephyrea, four plates (*Echiurus Pallasii*).

SOCIETIES AND ACADEMIES

PARIS

Academy of Sciences, September 27.—M. Wurtz in the chair.—The following papers were read:—On the non-recurrence of the anthracoid affection, by MM. Pasteur and Chamberland. Their experiments prove that in the case of *charbon*, as in that of chicken cholera, inoculations that do not prove fatal are preventive of a recurrence of the disease. M. Pasteur argues against M. Chauveau's theory that such non-recurrence is due to production of matters adverse to the proliferation of the bacterium. Experiments had been made with a view to testing a remedy for charbon devised by M. Louvrier, but were indecisive.—On the results obtained by M. Rondaire in his exploration of the Tunisian and Algerian chotts, by M. de Lesseps. M. Rondaire's conclusions are entirely favourable to filling the basin situated between the Gulf of Gabes and the projected line of railway from Biskra to Tuggurt. This would make an interior sea about 400 km. in length and 1,600 km. in circumference.—A vapour-tension manometer for analysing liquids and measuring pressures, by M. Perrier. A glass tube, tapering at the lower end, stands with this (open) end in mercury, contained in, but not filling, an oblong closed bulb, a few drops of a volatile liquid being imprisoned above the mercury. The liquid to be determined is heated in a small boiler and the bulb referred to is placed in the vapour. The liquid of the manometer (which should emit vapour of greater tension than the liquids examined) acts by its vapour on the mercury, forcing it up the tube to various heights.—On a property of Poisson's function, and on the integration of equations with partial derivatives of the first order, by M. Gilbert.—On the theory of sines of superior orders, by M. Farkas.—On the invention of binocular telescopes, by M. Govi. The invention is commonly attributed to the Capuchin monk Schyrleus de Rheita, who published an account of it in 1645. M. Govi finds, from the papers of Peirescq in the Bibliothèque Nationale, that a spectacle maker in Paris, D. Chorez, made and presented binocular glasses to the king in 1625, *i.e.* twenty years earlier.—On the difficulty of absorption and the local effects of the poison of *Bothrops jararaca*, by MM. Couty and Lacerda. Whichever the mode of introduction, cellular, muscular, or serous tissue, brain, heart, or lung, and whatever the quantity of poison injected (vascular ruptures and antecedent wounds apart), there is no distinct sign of penetration of the poison into the blood. There is always local inflammation, which for some organs may prove rapidly fatal. The lung is most sensitive in this respect, the stomach and intestine least.—Study of the vertebræ in the order of Ophidians, by M. Rochebrune.—On the ciliated embryo of the *Bilharzia*, by M. Chatin. The signification assigned by helminthologists to this embryo in the cycle of development of the species requires (in the author's opinion) to be profoundly modified (a superiority of constitution being observed).—Researches on the presence of micrococcus in the diseased ear; considerations on the *rôle* of microbes in auricular furuncle (boil) and general furunculosis; therapeutic applications, by M. Loewenberg. He has observed a microbe in furuncle of the ear. These small abscesses spread in the ear by what he calls *autocontagion*, and from individual to individual contagiously. In treatment he employs thymic or boric acid. In cases of neglected otorrhea or wetness of the ear, especially with fetidity, he has always found micrococcus in large quantity.

THE INDIAN FAMINE COMMISSION

THE recently issued Report of the Government Commission appointed some time ago to inquire into Indian Famines is of great practical value and full of suggestiveness as to the lines which further inquiry should pursue. This first part of the Report relates to Famine Relief, and bears evidence that the Commission have done their work with great thoroughness and breadth of view, and the results are recorded with clearness and method. On the question as to what measures of relief would be the most effectual to adopt, we need not touch here; no doubt they will receive attention in the proper quarter. The discussion of the various questions involved is prefaced by an excellent concise sketch of the geography, population, and climate of British India. Here also some important information is given as to the degree in which each part of the country is exposed to famine. This is followed by a statement of the measures which, in the opinion of the Commission, it would be advisable to adopt for famine relief, and a very complete and instructive review of past famines and the measures adopted to meet them. The immensity of the problem with which the Commission had to deal may be learned from the fact that the total area of British India is about one and a half million square miles with a population of 240 millions. Of this, 900,000 square miles, with a population of 190 millions, is under direct British rule, the remainder belonging to the native States. The great bulk of this population belongs to the classes on whom the dire effects of famine are sure to fall, so that the responsibility of our government in the matter cannot be magnified; they are bound to leave no means untried either to prevent the recurrence of famines or to meet them effectually if they do occur. The Commission, of course, could not but come to the conclusion that the devastating famines to which the provinces of India have from time to time been liable are in all cases to be traced to the occurrence of seasons of unusual drought, the failure of the customary rainfall leading to the failure of the food crops on which the subsistence of the population depends. The Commission have therefore justly conceived it to be an important part of their inquiry to ascertain what can be known as to the periodicity of rainfall throughout the year, and over periods of greater extent if possible. The yearly periodicity of rainfall in India and other tropical countries is well known. In India a strongly marked yearly periodicity is everywhere observed, the chief fall occurring, with few exceptions, in the summer months, between May and October, in the season commonly known as the south-west monsoon. On a part of the Madras coast, on the east of the peninsula, heavy rain falls after the cessation of these summer rains, in the months of November and December, at the beginning of what is termed the season of the north-east monsoon. In the more northern provinces, again, a well-marked season of winter rain occurs, commencing about Christmas and extending to February, but its effects hardly reach south of the tropic, and it has no sensible influence on the agriculture of Southern India. The main agricultural operations of the country correspond with these principal seasons of rain, and their relative importance is in a great degree dependent on the local distribution of the rainfall at the various seasons of the year, as the period and amount of rain differ much in the several provinces of India.

A most valuable feature of the Report is the numerous excellent maps which accompany it, and which are a great assistance to understanding the results of the inquiry. One map, for instance, shows the general features of the distribution of annual rainfall. The fall on the Western Ghats and on the tract between them and the sea is very heavy, being from 70 to 100 inches at the sea level, and as much as 250 inches on the mountain face exposed to the south-west rain-bearing winds. Along the east coast of the Bay of Bengal, and in the eastern districts of the Bengal Province, as also along the foot and outer slopes of the Himalaya throughout its whole extent, the rainfall is also extremely heavy, reaching 100 inches or more. Subject to these exceptions, it may be said generally that the portion of India east of the 80th meridian has a rainfall of more than 40 inches, while the portion west of the same meridian has less than 40 inches. The region in which the fall is less than 30 inches includes almost the whole of the Punjab, a considerable part of the North-West Provinces, a large part of Rajputana and Kathiawar, as well as almost the whole of the Deccan and Mysore. In Sindh and in the southern portion of the Punjab and most western part of Rajputana the rainfall is extremely small and irregular, being less than 15 inches. Of the area in which the rainfall is below 15 inches, it may be said that it is either actual desert or that agriculture is impossible without artificial irrigation; and hence it has followed that where the rain is least copious the population has made itself in a great degree independent of the local rainfall. In the opposite direction it is also generally true that where the rain is most abundant, exceeding 40 or 50 inches, the occurrence of such drought as will cause serious scarcity is rare. The region in which the average rainfall is between 20 and 35 inches is that which suffers most from droughts. Here, though on the average of years the rain is sufficient to support an agricultural population, the greater deficiencies which reduce the quantity below what is essential, as well as the smaller which seriously damage the crops, are so frequent as to lead to repeated seasons of scarcity of greater or less severity. From this it can easily be ascertained what are the parts of the country most subject to drought. These are (1) the western and southern parts of the North-Western Provinces and that portion of the Punjab territory which lies east of the Satlej; (2) the western and northern States of Rajputana and of the central plateau which border on the North-Western Provinces; (3) the districts of Bombay above the Western Ghats, and the districts of Madras above the Eastern Ghats, together with the southern and western region of Hyderabad and all Mysore, except the strip lying close along the Western Ghats; (4) the districts of Madras along the east coast and at the extremity of the peninsula. The more detailed account of the known droughts of the past hundred years, which are given, show how frequently the region whose total rainfall is from 20 to 35 inches has been subject to severe scarcity, and that within it have occurred the great famines of 1837–38 in the North-West Provinces, of 1868–69 in Rajputana, and of 1876–77 over nearly the whole of the peninsula of Southern India. These droughts were mainly due to the failure of the south-west monsoon. The drought of 1865–66, and some of the earlier scarcities in Madras, arose from failures of the rain of the north-east monsoon on the east coast, a failure which in 1865–66 extended into Western Bengal. The famine of 1873–74 in Northern Bengal was exceptional, and is an instance of a great scarcity suddenly arising in a region of abundant average rainfall. This drought arose from a premature cessation of the rain, apparently due to an abnormal extension to the eastward of the margin of the comparatively dry area of North-Western India.

The Report touches briefly on a part of the subject which we deem of the greatest importance, namely, the supposed periodicity of fluctuations in the rainfall from year to year. These, the Report states, are in all parts of the country very considerable, variations of as much as 50 per cent. on either side of the average being often registered. The Commission refer to the opinion of those "qualified by their scientific knowledge to judge of such matters that there is evidence of these fluctuations being in some measure synchronous with those periodical variations in the condition of the sun which are indicated by the varying extent or number of sun-spots; and the recurring cycle of about eleven years, with which prolonged observation has shown that the period of sun-spot variation on the average accords, has been thus considered to correspond to the annual variations of the rainfall, the maximum and minimum of the one approximating in period to those of the other."

Of course the Commission, in the present unsettled state of this all-important question do not feel themselves justified in recommending any anticipatory measures to be taken in view of the probable recurrence of famine, on the basis of this theory. The subject, it is admitted, is scarcely advanced enough to warrant such recommendations. What they do recommend, however, demands the serious attention of the Indian Government. They state that the subject "is one deserving of careful investigation, and that it does not seem contrary to reasonable expectation that some relation should be established between the variations of the rainfall from year to year and those of the conditions of the sun's surface, on the heat derived from which, unquestionably, all terrestrial meteorological phenomena closely depend. For various reasons India is a country in which the investigation of this matter may be carried out with especial facilities, and for this reason (though other grounds are not wanting) we would urge that, as the expense of such researches would be small, the measures which have recently been taken by the Government of India to carry them out should be continued, and even extended in the future."

"As at present no power exists of foreseeing the atmospheric changes effective in producing the rainfall, or of determining beforehand its probable amount in any season, *such* as would admit of timely precautions being taken against impending drought, the necessity becomes the greater for watching with close attention the daily progress of each season as it passes, for ascertaining with accuracy and promptitude the actual quantity of rain in all parts of the country, and for forming the best and earliest judgment possible from the facts as they occur, whether the supply will be sufficient or otherwise. For the present at least, so far as the rainfall directly affects the subject under consideration, these are the only precautions that appear possible. Within the last few years a very satisfactory system of meteorological observations has been established all over British India, and in our opinion it is of primary importance that it shall be maintained in complete efficiency, and shall so far be strengthened and improved as to insure the early and punctual supply of information to the executive governments, and to the officials in all departments concerned with the agriculture of the country or the preparations required to meet famines, as to the actual progress of the periodical seasons of rain in all parts of the provinces for which those governments or officers are respectively responsible. So far as it may become possible, with the advance of knowledge, to form a forecast of the future, such aids should be made use of, though with due caution.

"We are also satisfied of the importance of the diffusion of more sound and accurate knowledge of the causes and mode of occurrence of the periodical rains, on which the well-being of India is so largely dependent, not only among the officers of the Government, but also among all classes of the community. Any measures which the Government may find possible with a view to the publication and diffusion of such knowledge cannot fail to be highly beneficial."

We shall look with interest for the further information on this subject, which is promised in the appendix to the Report. We need not add anything in support of the strong recommendation of the Commission. The Government would certainly not have appointed them at all unless it meant to take action upon their recommendations, and surely no line of inquiry is more promising, or could be fraught with more useful results. If the laws (for there can be no doubt that such exist) which regulate the periodicity of droughts can be clearly ascertained, it would reduce to the limit of simplicity the measure to be adopted either to prevent the occurrence of famines or to be prepared long beforehand to prevent their natural consequences.

Other recommendations of the Commission are quite in keeping with that to which we have just referred. They advocate the introduction of a more scientific method into administration and statistics, the institution of a separate agricultural department, and the need of improved agricultural, vital, and economical statistics.

Besides the map already mentioned, there are others showing the extent and comparative severity of the famines in various districts of India, from the beginning of the century downwards. Altogether the Commission have faced their task in a thoroughly business-like and scientific method; while they have sought information from every quarter likely to yield useful results, they have never lost sight of the object they had in view, and their Report is likely to be of permanent value. We shall look for the further record of their proceedings with the greatest interest.

GAMGEE'S "PHYSIOLOGICAL CHEMISTRY"

Physiological Chemistry of the Animal Body. By Arthur Gamgee, M.D., F.R.S., Brackenbury Professor of Physiology in the Owens College, Manchester. Vol. i. (London: Macmillan and Co., 1880.)

THE title of this book, since it seems to indicate that the work treats of a division or kind of chemistry, suggests the question whether it ought not to have been written (and reviewed) by a chemist rather than by a physiologist. And indeed there was a time when the view that the chemistry of living beings was a kind of chemistry distinct from the ordinary chemistry had some measure of support, and when consequently the phrase physiological chemistry had a very definite meaning. At the present time however all or nearly all are ready to admit that the chemical events which take place in living bodies are in reality of the same kind as and subject to the same chemical laws as those which take place in lifeless things; and hence physiological chemistry has come to mean the same thing as chemical physiology. The study of the chemical phenomena of animals and plants may be undertaken either by the chemist who understands physiology or by the physiologist who knows chemistry. The day must sooner or later come,—may its advent be more speedy than the present outlook promises! —when the chemist will be able, on the strength of his general knowledge, to foretell with sureness and precision the varied chemical events of the animal body; but hitherto and as yet, each chemical twist and turn of the vital machine has to be worried out by direct observation and experiment, so that physiological chemistry really means at present the physiological investigation of the chemical phenomena of living beings, and thus naturally falls into the hands of the physiologist.

For some years past there has been a great want of an adequate English treatise on the subject, a treatise which should deal with the matter much more fully and completely than could possibly be done in the text-books of physiology or chemistry. The preparation of such a treatise, however, is a task of great labour, and Prof. Gamgee assumed a heavy responsibility when he undertook to bring out the work, the first volume of which is now before us. But we believe that we may congratulate him and his readers on the accomplishment, so far, of his task.

The first instalment comprises, besides a preliminary chapter on proteids, an account of the chemistry of blood, pus, lymph, and of the elementary tissues, contractile, nervous, connective, and epithelial. About 200 pages are devoted to blood alone, and these not only contain a full description and discussion of the phenomena of coagulation, of the chemistry of the serum, and of the red corpuscles, both of their stroma and their hæmoglobin, but include a special chapter "on the changes which the blood undergoes in disease," and a section on the "characters presented by the blood of invertebrate animals." Prof. Gamgee's object has been apparently threefold, viz., (1) to give the chemical data as fully and as exactly as possible, with abundant references to original memoirs and other authorities; (2) to explain even in detail the methods by which the data are determined, and in this the reader will have at once his attention arrested and his progress assisted by the illustrations of apparatus, spectra, &c., the number and excellence of which form a very striking feature of the work, distinguishing it in a most marked manner from its predecessors; and (3) to point out and discuss the physiological bearings of the data expounded. Thus under the heading of "Oxy-hæmoglobin" will be found a description of the various methods of preparation of this substance (some eight special methods being given in detail in small print), followed by an account of its elementary composition, crystalline form, general reactions, and absorption-spectra. The physiological properties of hæmoglobin are in large measure postponed to the chapter on respiration; but the *technique* of spectroscopic examination is fully described, including the method of recording absorption-bands in wave-lengths; and hæmatin, with other derivatives and allies of hæmoglobin, as well as the action of carbonic oxide and other gases, are treated at length. The account of blood ends with a "description of certain methods of research not described in preceding sections," such, for instance, as the determination of the specific gravity of blood, the quantitative estimation of its various constituents, normal and abnormal, the extraction and measurement of the gases of blood, the measurement of the total quantity of blood in the body, &c., &c.

The other parts of the book are written in a similar fashion, and as far as we have at present, from the sections which we have subjected to a more detailed examination, been able to judge, the author has spared no pains to insure accuracy in his facts and statements, as he has certainly shown judgment in his selections, while his descriptions are remarkably clear and easy to understand.

The prominence given to methods, and the richness in illustrations, make the book one of great value to the student. There are books, some of them professedly written for students, which, though of much worth in other respects, are from the student's point of view practically useless: books of which the student's own judgment is that "he cannot find what he wants" in them. We venture to think that it will be the student's own fault if he cannot find what he wants in Prof. Gamgee's work; that is to say, if he wants what he ought to want. If he seeks in it a compendium which will give him just that amount of knowledge which may be required for an examination, so prepared as to be most easily absorbed and retained for the few weeks which precede his ordeal, he will very probably be disappointed. But if he desires to understand the chemistry of the animal body he will find it an admirable guide, and especially a most valuable book of reference. Throughout the whole of physiology, and at least no less in the chemical than in other parts, the value of the data and the trustworthiness of the conclusions founded on them depend very largely on the methods employed; and no student can form an intelligent judgment on the chemical phenomena of the body who has not understood and appreciated the methods by which the various investigations have been carried out. Hence we lay especial stress on this feature of the book before us as most important for the student.

Prof. Gamgee has gone largely into detail and even into controversy; and in this point too we think he is right. The outlines of physiological chemistry are already present in the various text-books of physiology; what was emphatically wanted was a history and discussion of details to give shape and fulness to the more meagre accounts found elsewhere. Doubtless many will say that the work contains a great deal more than can possibly be wanted by the student of medicine or even of physiology. We will not presume to answer the difficult question, How little physiology a medical student may know without his educational status being considered "mean"; but this we may say, that there is not a page in this work, the study of which will not prove profitable not only to the medical student, but even to the medical practitioner.

We trust that the author will as soon as possible be able to complete a work of which the first part will increase his already high reputation, and certainly must be regarded as a most noteworthy addition to English physiological literature.

M. FOSTER

PEAT-MOSSES

The Sphagnaceæ or Peat-Mosses of Europe and North America. By R. Braithwaite, M.D., F.L.S. (London: David Bogue, 1880.)

THE peat-mosses are a peculiarly interesting group of cryptogamic plants, which has attracted the attention of even ordinary observers from a very early period. No group of plants is more clearly defined in structure, in family likeness, and by the localities in which they are found. The wanderer over our moorlands, the sportsman in pursuit of game, are as familiar as is the botanist with their dense green or ruddy-coloured tufts, now covering over some damp spot or filling up some bog hole with a vast mass of vigorous vegetation. Nor is there wanting to them an economic value, and that of too great an importance to be overlooked by even the most careless, for it is past generations of these bog-mosses which form the vast deposits of peat, for which as an article of fuel no substitute is in many parts of Europe attainable. The name sphagnus was first used, by writers like Theophrastus and Pliny, to indicate some of the spongy lichens, but was restricted to a genus of mosses by Dillenius more than a century and a half ago, "which were like none of the terrestrial mosses, but were produced always in bogs and marshes."

Dr. Braithwaite, in the volume before us, gives a most excellent sketch of the literature of the genus, tracing it from Dillenius, Linneus, Hedwig, to Müller, Wilson, Sullivant, Schimper, Lindberg, and others. For a long time Prof. Schimper's work was the best on the subject, and Dr. Braithwaite mentions it as very complete in its details of structure, both descriptive and pictorial, and as leaving hardly anything to be desired. Of works more especially relating to the development and minute anatomy of the group, allusion is made to the important memoirs of von Mohl, Carl Nägeli, Dozy, Hofmeister, Russow, Piré, and Rozé. He then proceeds in a second chapter to some general observations on collecting, preparing, and on the points to be observed in the determination of a species.

In a third chapter the vegetative system of the group is discussed. To our mind this chapter might well have been extended. The details given of the germination of the spores are too few, nor is the following chapter on the reproductive system free from the same defect; and as to the illustration of these two chapters, it will suffice to mention that it is confined to a single plate. As the charming plates illustrating the descriptive portion of the work are, we trust, likely to serve for more than one edition of it, we would suggest that, in the event of a second edition, some half-dozen supplementary plates might be given, on which would be represented the embryology of the group.

Between fifty and sixty species of Sphagnum are known, of which about one-third are tropical. They are most abundant in the north and south temperate zones, in the higher latitudes of which they often cover over a large expanse of surface. Dr. Braithwaite describes twenty species as found in Europe and North America, that is about one-third of all the known species. Of the others, seven species are described as from Brazil, seven from Central America, four from Guadaloupe, seven from Australia and New Zealand, four from the Eastern Archipelago, two of these, *S. sericeum*, C. Müll., and *S. Holleanum*, Dozy and Molk, known only in a barren state, but remarkable for having the stem leaves precisely like the branch leaves in form and structure, their hyaline cells being without fibres, but with a single apical pore. The only species from tropical Africa is *S. Africanum*, Duby.

Dr. Braithwaite points out that the range of variability in the species is in this group most extensive, so that in their determination one must rely on minute anatomical distinction for their essential characters, as in many cases size, colour, direction of leaves, habit, presence or absence of fibres in the hyaline cells of the stem leaves, will all alike fail. In the separation of the Sphagninæ as a subclass from the Bryinæ or frondose mosses, Dr. Braithwaite follows the earlier views of the illustrious Schimper. He groups the species described in nearly the same manner as Lindberg, adopting his three sections—Eusphagnum, Hemitheca, and Isocladus. The European species are all located in the first section. The descriptive details are very clearly given. The synonymic lists are evidently made out with great care, and the varieties which in many of the species are, as is well known, very marked, are not only described, but in several cases figured. The twenty-eight beautiful coloured plates illustrating the species and varieties are all from drawings by the author, and they contain complete anatomical details of the stem and leaf structures. The work is brought out in a style worthy of the subject, and we trust will find its way not only into the hands of the botanist, but, as it well deserves to do, into the possession of all who take an intelligent pleasure in studying our native mosses.

OUR BOOK SHELF

Vox Populi: a Sequel to the "Philosophy of Voice." By Charles Lunn. (London: W. Reeves, 1880.)

WE are told in the preface that "the present work is a reprint of articles that appeared in the *Orchestra*," and that "now it has been discovered Galen (A.D. 180), 'the father of physicians,' as he is called, advanced the same physical views as those for which I (Mr. Lunn) have contended, my controversial work is ended:—it is scarce worth while to re-write." Was it then worth while to re-print? In the introduction the author tells us that his articles were written "to clear up some ambiguous points in my (Mr. Lunn's) 'Philosophy of Voice,'" and that "this without the former work is incomplete, as that without this." Some time ago the present writer honestly endeavoured to understand Mr. Lunn's "Philosophy of Voice," and utterly failed in his attempts. He cannot find any assistance towards understanding it in the present little tract (pp. 88) of loose writing, wonderful reasoning, and jumping exposition. Let us hope that Mr. Lunn's teaching is better than his preaching. His axioms are however rather startling, especially the second (p. 7), "All voices are naturally beautiful. All ugliness in vocal tone is the result of transferred habits acquired by the artificial use of voice in speech." If this use is "artificial," what use is "natural"? But attempts to understand and criticism are all thrown away. Notwithstanding Mr. Lunn's initial confession that he is a mere follower of Galen, he declares in his introduction (p. 1): "It is a *fait accompli*. *I* have founded a New Profession standing midway between the Musical and the Medical worlds, with Art on its one side, Science on the other; firm and irrefutable.". In this state of suspension, like Mahomet's coffin, "midway between" two "worlds," and belonging to neither Science nor Art, which seems fitly to describe the nature of the book, we are content to leave it to the happy conviction of the author that what he says (of course when others can find out what it is) is "firm and irrefutable."

Practical Plane Geometry and Projection for Science Classes, Schools, and Colleges. By Henry Angel. Vol. I., Text; Vol. II., Plates. Collins's Advanced Science Series. (London and Glasgow, 1880.)

A VERY practical and useful book by an experienced teacher: it is designed to meet the requirements of students at the Royal School of Mines, at the Royal Military Academy, at Cooper's Hill, and elsewhere, and embraces great part of the two higher stages of the Science and Art Department syllabus. There is no great scope for absolute novelty in such a work, and our author acknowledges his indebtedness to the works of many, if not most, of his well-known predecessors, but the arrangement appears to be judicious, and the constructions good and clearly enunciated. In the Practical Geometry (six chapters) the student is taught the use and construction of scales, of triangles and polygons, and there are numerous problems on areas, on circles in contact, and on other plane curves with their tangents and normals. The orthographical portion treats of the projection of the five regular solids, of other simple solids, of flat and curved surfaces, intersected by cutting planes, and of solids inscribed in, or circumscribed to, the surfaces of other solids; of the interpenetration of solids, of the projection of shadows, on isometric projection, on the solution of the spherical triangle, and on horizontal projection—a very extensive and varied bill of fare. In addition there are numerous questions for practice, many of which are taken from examination papers, and the text is illustrated by several clearly-drawn figures. Part ii. contains eighty-one large-page plates to further illustrate the constructions. The two parts together ought to enable any painstaking student to take a creditable place in his examination and to acquire a solid acquaintance with the subject.

Teorica delle Forze Newtoniane e sui applicazioni all' Elettrostattica e al Magnetismo del Prof. Enrico Betti. 365 pp. (Pisa, 1879.)

IN the session 1863-64 Prof. Betti delivered at Pisa a course of lectures, subsequently (1865) printed in the *Nuovo Cimento* under the title "La Teorica delle Forze che agiscono secondo la legge di Newton e sua applicazione alla elettricità statica"; the volume before us is what may be looked upon as its greatly enlarged second edition. It consists of an introduction and three chapters. The first chapter, in twenty-three sections, treats of Potential Functions and of Potentials (§ 11 gives Green's theorem and some others due to Gauss; § 12 Stokes's theorem for transforming a double integral into a simple integral, and the properties of a surface which has on one face a stratum of attracting, and on the opposite face an equal stratum of repulsive, matter; the other sections appear to contain nearly all the known properties of these functions). Chapter II., on Electrostatics, in sixteen sections, discusses several cases of electrostatical distribution, the method of images (Sir W. Thomson's theory) and condensers; Chapter III., on Magnetism, is divided into ten sections (on p. 304 Prof. Betti announces the theorem, "Se la superficie di un corpo è semplicemente connessa ed ha un numero finito di poli, questo numero sarà sempre pari," an advance upon Gauss, who has shown that if there be three poles there must also be a fourth).

Kalkül der Abzahlenden Geometrie. Von Dr. Hermann Schubert. (Leipzig: Teubner, 1879.)

DR. SCHUBERT in this work gives us, in the form of a treatise of 359 pages, the principal results as yet arrived at in the "Numerical Geometry," a branch of mathematics originated by M. Chasles and subsequently studied by Zeuthen, Sturm, Halphen, Klein, and in this country by Dr. Hirst ("On the Correlation of Two Planes," vol. v.; "Correlation in Space," vol. vi.; "Note on the Correlation of Two Planes," vol. viii.; London Math. Soc. *Proceedings*). The book closes with a full historical and bibliographical list in the form of notes to the several chapters.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*]

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

The Spectrum of Hartwig's Comet

THE spectrum of this comet was examined here on the evening of October 7 with a spectroscope having a single prism of 45°, and was found to consist of three bright bands and a continuous spectrum corresponding to the nucleus. The middle and brightest band was compared with the band at W.L. 5198 in the spectrum of a vacuum tube containing alcohol vapour, and three micrometer measures gave the position of the less refrangible edge of the comet band at W.L. 5184, 5215, and 5204 tenth metres respectively. The breadth of the band was about 40 tenth metres. These measures would indicate that the principal comet-band is coincident with the band at W.L. 5198 of the vacuum-tube spectrum of carbon-compounds, and not with that of the Bunsen-flame at W.L. 5165. The observations however were made under unfavourable circumstances, the comet being low, and involved in haze and cloud. The positions of the other two bands were not determined.

W. H. M. CHRISTIE

Royal Observatory, Greenwich, October 11

Wire Torsion

I HOPE you will allow me to seek information, through your aid, on a subject which is perplexing me a good deal at present. I am engaged in studying a gravimeter designed by the late J. Allan Broun, in which gravity is balanced by the torsion of a single wire; or is intended to be so. As the function of the instrument depends largely on the law of torsion in wires, I have been making experiments to satisfy myself on some points. It is in the results of one of these that I have met with my difficulty. I was using thin brass wire (diam ·02), and after stretching it till it broke, twice, I supposed it to be at or near its maximum elasticity, and proceeded to use it in the intended way. At each end of a 6-foot plank I inserted into the edge a 2-inch screw. The wire was fastened upon these so as to get a strain by turning them. The wire was in two pieces, attached to opposite sides of a ring in the middle. By turning this ring the two wires were severally twisted in opposite directions. A straight thick wire passed through the ring, the weight of which afforded a ready means of varying the force necessary to balance the torsion of the wire. My first object was to prove that the force of the latter was, at any rate to some considerable extent, independent of the tension. Suppose that with this arrangement, the wire being horizontal, a balance has been effected when the ring has been turned about the wire as an axis three or four times. What will happen when the wire is further strained? I think it would be a natural expectation (apart from special knowledge) that the weight will rise; on the other hand, a knowledge of the law of torsion teaches (?) that there is no increase of the force sustaining the weight, which therefore will *not* rise. But who would suppose that, on the contrary, it would sink? Such, nevertheless, is what takes place. I continued increasing the strain, and the weight continued to sink. I had to go on lessening the weight again and again (by shifting the balancing cross-rod), in order to restore the horizontality of the ring; until at last there was scarcely any force of torsion left! To repeat the experiment of course the ring had to receive three or four fresh turns. I did so several times, always continuing, as I thought, to increase the strain. All the time the wire was absorbing the torsion, and did not break. I then thought to try the effect of a high initial torsion. But I did not seem to get any such by turning the ring more than five or six times. I then thought to see how much twisting the wire would bear. Expecting it every instant to break, I counted up to 100 half turns. *By this time the wire was quite slack!* I added *another hundred* half turns. The wire was now half an inch longer, without any strain having been kept on it except just enough to keep it straight. I went on twisting. At 218 one wire broke. The other then had only sixteen half-turns of twist in it, out of the 230 or more received. I afterwards went on twisting, mending each time that the wire broke, till the twist (quite visible under the microscope) amounted to sixteen turns per inch. The length kept on increasing. After breaking, the wire always untwisted one turn in four inches.

I feel myself here in presence of laws of which I know *nothing;* and my object in writing this short experience is to ascertain whether it is sufficiently in accord with what *is* known to cause no surprise to any one but myself. In that case I shall be greatly obliged to any one who will tell me where I can learn all about it. J. HERSCHEL

Collingwood, October 4

I forgot to say that in no case did slackening of the strain reverse the sinking of the weight due to increase of strain.

The Magnetic Storm

BY the mail just arrived from Australia I have received copies of the photographic traces produced by the declination magnetograph at the Melbourne Observatory during the magnetic storm of August 12 to 14, kindly forwarded by Mr. Ellery, the Government astronomer there.

A comparison of these curves with those from the Kew instrument for the same period shows that the disturbance commenced and ended at both places at the same time.

It is not easy however to trace much similarity in the two sets of curves, as the individual excursions of the magnet east and west of the normal position which form the record of the magnetic storm, cannot be at all times followed in both curves, but the periods of greater disturbance seem to have been simultaneous. For example, the commencement of the disturbance was well marked at August 11d. 8h. 10m. p.m. at Melbourne, which corresponds to 11d. 10h. 33m. a.m. G.M.T., whilst here (*vide* Mr. Ellery's letter in NATURE, vol. xxii. p. 361) it commenced at 10h. 30m. a.m.; then again the large deviation to the eastward noted in the Rev. S. J. Perry's letter in NATURE, which occurred here between 12d. 11h. 30m. a.m. and 12h. 30m. p.m., seems to have had its effect, as a movement of the needle at Melbourne to the westward between 12d. 9h. 15m. p.m. and 10h. 30m. p.m. The maximum deflection which exceeded the limits of registration of the instrument, I estimate to have taken place at 10 p.m. The corresponding G.M. times for the above are 12d. 11h. 38m. a.m., 12h. 53m. p.m., and 12h. 23m. p.m.; the maximum deflection recorded here seems to have been at 12h. 25m. p.m.

The disturbed period may be considered to have died out at Kew at 14d. 8h. a.m. G.M.T., and at Melbourne at about 14d. 7h. a.m., but there is no very distinctive movement which would enable us to fix this limit with accuracy.

These interesting comparisons are extremely satisfactory, for it is but recently that the Government of Victoria was considering the advisability of discontinuing the system of photographic registration of the magnetometers at Melbourne, and consulted the Kew Committee upon the subject.

A circular was accordingly issued to the leading physicists of Europe, and their replies being almost unanimously in favour of the continuance of the recording system, the Government erected a new magnetic observatory, and decided upon carrying on the work.

Mr. Ellery has also forwarded a month's curves for the purpose of assisting in the international comparison of magnetograms now being prosecuted by the Kew Committee.

The preliminary results of their investigations have been already indicated by Prof. Adams in his recent speech at Swansea (NATURE, vol. xxii. p. 416). G. M. WHIPPLE

Coral Reefs and Islands

I HAVE been greatly interested in Mr. John Murray's paper on coral reefs and islands published in NATURE, vol. xxii. p. 351. I hope you will allow me space to draw scientific attention to the fact that as early as 1857 I published a paper on the Formation of the Peninsula and Keys of Florida (*Am. Jour.* vol. xxiii. p. 46), in which I maintain that the theory of Darwin, although so beautifully (as I thought) explaining the phenomena of the Pacific reefs, *wholly fails to explain those of the Florida coast.*

In 1851 I spent the months of January and February on the Keys of Florida, assisting Prof. Louis Agassiz in his investigations on the growth of reefs and formation of keys in this region. An abstract of these investigations and their results was published in the Report of the United States Coast Survey for 1851, p. 145 *et seq.*[1]

In this report Agassiz shows that the Keys and nearly the whole Peninsula of Florida have been formed by the growth of successive reefs, one beyond the other from north toward the south. In my paper above alluded to, and also in my "Elements of Geology," p. 152, I state further, that the reefs of Florida, if we accept Darwin's theory, are entirely peculiar. For according to Darwin barrier-reefs are formed *only by subsidence,* while on the Florida coast we have well-marked barriers with channels 10–40 metres wide where there cannot be any subsidence, for continuous increase of land is inconsistent with subsidence. Again, according to Darwin barriers and atolls always show a *loss of land,* only a small portion of which is recovered by coral and wave agency; while on the Florida coast, on the contrary, there has been a continuous growth of the Peninsula by coral accretion, until a very large area, viz., about 20,000 square miles, has been added.

I have attributed the formation of *successive* reefs from north toward the south to the successive formation of the depth-condition necessary for coral growth; and this latter, in the absence of any evidence of elevation, to the steady building up by sedimentary deposit, and extension southward, of a submarine bank within the deep curve of the Gulf Stream. The formation of barriers instead of fringes on a coast which has certainly not subsided—for continuous land-growth negatives the idea of subsidence—I attribute to the shallowness and muddiness of the bottom along this coast. Only at a distance of twenty to forty miles, where the depth of twenty fathoms is reached, and where, therefore, the bottom is no longer chafed by the waves, the conditions necessary for coral growth would be found, and here a line of reefs would be formed, limited on one side by the depth and on the other by the muddiness of the water.

In brief then, according to my view, the Peninsula and Keys of Florida were formed by the co-operation of several agents:— 1. The Gulf Stream building up and extending a submarine bank within its loop. 2. Corals building successive barriers on the bank as the latter was pushed farther and farther southward. 3. Waves beating the reefs into lines of islands. 4. *Débris* from the reefs and keys on the one side and the already formed mainland on the other filling up the successive channels and converting them first into swamps and finally into dry land.

Whether this view is true in all its parts or not, there can be no doubt that the southern coast of Florida affords exceptional advantages for the successful study of the formation of coral reefs. JOSEPH LECONTE

Geological Climates

THE dilemma into which Dr. Houghton thrusts the rigid uniformitarian school is one which was enlarged upon some years since, when reef-building corals were asserted, upon the evidence afforded by fossils, to have existed during the Miocene and Oligocene ages in seas where Tasmania now exists in the south and Hampshire in the north. There are no instances of large masses of reef-building corals in corresponding latitudes at the present day, and the range of these surface-living, high-temperature-requiring zoophytes is well known.

Uniformitarians may take comfort, however, and slip under the horns which Dr. Houghton so ably presents for their transfixment. Where I now write, on the Bagshot sands and gravels of Cooper's Hill, facing the cold north with a touch of the east, there is a patch of bamboo canes in full leaf. They were in full leaf at this time last year. The plant survived out of doors the extreme frost and fogs of last winter and other evidences of a temperate climate, and it has been in beautiful leaf all this summer.

Now everybody knows that in torrid India the bamboo grows. Therefore if the palæontologist of the year A.D. 18800 should dig up the Cooper's Hill stalks and leaves, and should have the opportunity of examining in some future Kew the bamboos of the hot parts of the earth, he would logically, geologically, palæontologically, but somehow unreasonably, come to the conclusion that Cooper's Hill and India enjoyed corresponding and intensely tropical climates in 1880, during the geological age when the earth's polar axis was certainly inclined nearly 23½° to the plane of the ecliptic. P. MARTIN DUNCAN

The Yang-tse, the Yellow River, and the Pei-ho

I HAVE been much interested in the paper on the above rivers, published in NATURE, vol. xxii. p. 486. To the extent of the writer's personal observations the calculations appear to have been careful and accurate, and as near the truth as the observations of a single year are likely to be. A reference to Sir Charles Hartley's observations of the Danube, extending over *ten* years, shows that the mean maximum discharge of that river for one year exceeded the minimum by 3 to 1.

It is however to the use of *one* observation of the Yellow River made in 1792 by Sir Geo. Staunton that I feel compelled to enter a protest, firstly, because *one* observation is misleading in drawing general inferences, and, secondly, is especially to be suspected when it is at variance with other well authenticated examples.

According to the writer of the paper, the mean discharge of the Yang-tse is 770,397 cubic feet per second, carrying to the sea 6,428,800,000 cubic feet of sediment per year, but the Yellow River having only a mean discharge of 116,000 cubic feet per second delivers, according to Sir George Staunton, 17,520,000,000 cubic feet of sediment per year into the Gulf of Pe-Chili. With Dominie Sampson we may well exclaim "prodigious!" It has struck me as an explanation of this anomaly that Sir George Staunton probably measured the deposit from "the gallon and three-quarters" of the Yellow River water as *wet mud.*

If so this will at once account for the excessive amount of it. The deposit of Nile mud in the reservoirs of the Cairo waterworks often amounts to 1 inch in 10 feet of water,[1] or $\frac{1}{120}$ part of the bulk. Dr. Letheby's analyses show that in August the proportion by weight of sediment (dried) being the maximum of the year, in Nile water is $\frac{1}{870}$[2]: thus taking the specific gravity of the dry mud at 1·9, the measurement of the wet deposit by bulk exceeds the dry about 10½ times.

If the 80 grains to the pint of the Yellow River water be divided by 10½, we arrive at between 7 and 8 grains per pint of dry sediment, corresponding closely with the proportion given by the writer for the Pei-ho and Yang-tse.

I would also point out that the discharge of the River Plate as given in the table is not the *mean*, which has not yet been ascertained, but the *dry weather flow*.[1] Still another little error, for which the writer is in no way responsible, being a quotation from Huxley's "Physiography." The discharge of sediment by the Thames is a calculation by Prof. Geikie on an *hypothesis*, not on observation; and instead of 1,865,000 should be 18,650,000—this printer's error has been copied from Geikie's original paper by writer after writer without discovery.

I should feel obliged if the writer would explain why the surface-current of the Yang-tse and Pei-ho should vary so in velocity with the same average depth of water. It seems anomalous. T. MELLARD READE

Miller's Elements of Chemistry—Part III. Organic Chemistry

IN his notice of the new edition of this work, by Mr. Groves and myself, which appears in NATURE, vol. xxii. p. 530, Mr. Muir refers to an obvious omission at p. 933. May I request those who possess the book to insert at the top of the page the words "Probably, however, the most weighty objection that can be raised to the" . . . Although in the revise, by some strange mischance this line has been dropped in printing off.

HENRY E. ARMSTRONG

Swiss Châlets

IDENTICAL suggestions to those of Mr. George Henslow with regard to the connection in descent of modern Swiss châlets with ancient pile lake-dwellings will be found expressed in Dr. J. J. Wild's "At Anchor" (Marcus Ward and Co.), p. 106, and with some detail in my "Notes by a Naturalist on the *Challenger*" (Macmillan and Co.), p. 399. Dr. Wild, who is a native of Switzerland, and I arrived at the same conclusions independently, as we only found out on reading one another's books, from the study of the modern pile dwellings of the Malay Archipelago during the voyage of the *Challenger*, and we both amongst other conclusions identified the balcony of the châlet with the ancient platform, as does Mr. Henslow. Spectre of the Brocken at Home

HAVING occasion ten days ago to go into my garden about half past ten o'clock at night I found there was a thick white fog, through which, however, a star could be seen here and there. I had an ordinary bedroom candlestick in my hand with the candle lighted, in order to find the object I wanted. To my great surprise I found that the lighted candle projected a fantastic image of myself on the fog, the shadow being about twelve feet high, and of an oddly distorted character, just as the spectre of the Brocken is said to be. It is of course usual on going into the open-air to use a lantern with a solid back for any light that may be wanted, and with this, of course, such a shadow would not be seen; but in this charmingly foggy valley of the Thames, and in these days of "Physics without Apparatus," the effect I saw can probably be seen only too often. May not the gigantic spirits of the Ossianic heroes, whose form is composed of mist, through which the stars can be seen, be derived from the fantastic images thrown upon the mountain fogs from the camp fires of the ancient Gaels? In a land where mists abound a superstitious people might very readily come to consider a mocking cloud-spectre to be supernatural, though it was really their own image magnified. If it be true that in our earlier stages of development we resemble more nearly the past forms of life and thought, I may mention in this connection that, thinking to amuse a little child of three, I threw a magnified shadow of her on the wall with a candle, and then, by moving it in the usual way, made the figure suddenly small. Instead of the changing shadow giving the pleasure intended, the child was terrified, as the warriors of Morven may have been when they saw their shadows on the clouds. J. INNES ROGERS

Putney, October 8

Ice under Pressure

THERE is a point in Dr. Carnelley's letter (NATURE, vol. xxii. p. 435) which I have been hoping to see cleared up by subsequent letters. He says, "In order to convert a solid into a liquid the *pressure* must be *above* a certain point," and goes on to describe some experiments with ice, implying that ice is in this respect a typical substance. Now our text-books speak of the behaviour of water in freezing and melting as exceptional. For instance, Prof. Balfour Stewart says ("Heat," p. 89): "If a substance expands in congelation, its melting-point is lowered by pressure, but if a substance contracts in congelation, its melting-point is raised by pressure." And (p. 91): "Bunsen found that the melting-points of paraffin and spermaceti, both of which contract when freezing, were raised by the application of pressure."

Mr. Haddon's Marine-Zoology Class

OWING to misconceptions which have arisen from the notice in NATURE, vol. xxii. p. 517, relative to my marine-zoology class, I should like to state that this class was formed solely for the purpose of the practical study of marine zoology, and without any idea of founding a zoological station. I would also like to take this opportunity of acknowledging my great indebtedness to Prof. Dohrn's magnificent institution at Naples.

Zoological Museum, Cambridge ALFRED C. HADDON

Landslips

I READ with great interest the article on landslips in NATURE, vol. xxii. p. 505. It is no doubt familiar to many that the salt districts of Cheshire, in the neighbourhoods of Northwich and Winsford, are subject to landslips of a peculiar kind. The beds of rock salt occupying the position of the Triassic salt lakes are the centre of an extensive underground drainage. The fresh water on reaching the salt proceeds to dissolve it and becomes brine. This brine is pumped up and manufactured into white salt. As the fresh water keeps constantly dissolving and eating away the solid salt, the superincumbent earths keep sinking, and on the surface deep furrows, like the dried beds of rivers, mark the course of the underground waters. At times enormous masses of earth sink bodily, leaving cavities of a funnel shape. A short time since a mass of at least 60,000 tons of earth suddenly disappeared. When these subsidences are near rivers they become filled with water, and large lakes over 100 acres in extent have been formed. Although houses are not overwhelmed they are very frequently destroyed, and this destruction of property is so serious that the sufferers are now about to appeal to Parliament for assistance.

The district of the salt manufacture presents phenomena both curious and interesting, and is well worth visiting. A fortnight ago the whole of the water in one of these subsidences of over five acres in extent disappeared, leaving a chasm or abyss in many places forty or fifty feet deep. The action of water on soluble rocks can be seen here in great perfection.

LIQUEFACTION OF OZONE

AT a recent meeting of the French Academy, MM. Hautefeuille and Chappuis announced that they had liquefied ozone. These chemists have been able to ozonise oxygen to a greater extent than has hitherto been done, by passing the silent discharge through the oxygen at a low temperature. The tube containing oxygen was immersed in liquid methylic chloride, which boils at -23°. After being submitted to the electric discharge for fifteen minutes at this temperature, the oxygen was conducted into the capillary tube of a Cailletet's apparatus, the temperature of which was maintained at -23°.

After a few strokes of the pump the gas in the tube appeared azure blue; as pressure increased the depth of colour likewise increased, until under a pressure of several atmospheres the ozonised oxygen appeared dark indigo blue. The pressure was increased to ninety-five atmospheres, and was then suddenly removed, whereupon a mist, indicating liquefaction, appeared in the capillary tube.

The stability of a mixture of oxygen and ozone rich in ozone appears to be chiefly dependent on the temperature. If such a mixture be rapidly compressed at ordinary temperatures, a considerable amount of heat is evolved and the gas explodes.

Ozone, say MM. Hautefeuille and Chappuis, is therefore to be placed in the category of explosive gases.

Berthelot has shown that the transformation of oxygen into ozone is attended with absorption of heat: the stability of products of endothermic reactions is as a rule increased by decreasing temperature.

Ozone is much more easily liquefied than oxygen; the latter must be compressed under 300 atmospheres at about the temperature of -29° before sudden removal of pressure succeeds in producing liquefaction.

We have thus the existence through a large range of temperature and pressure of two allotropic forms of the same element; each with distinctly marked chemical and physical properties. We know that the molecule of oxygen has a simpler structure than that of ozone; the substance of simpler molecular structure is capable of existing through a much more extended range of temperature and pressure than that of more complex structure. Under special physical conditions it seems possible that new allotropic modifications of various elements might be produced.

The marked differences in colour, and in temperature of liquefaction, between oxygen and ozone, furnish another illustration of the close connection which exists between the "chemical structure" and physical properties of substances; a different "linking," even of similar atoms, being evidently associated with distinctly different physical properties.

MM. Hautefeuille and Chappuis will doubtless soon be able to furnish more details of the properties of this most interesting substance, liquid ozone. M. M. P. M.

THE UNIVERSITY OF NEW ZEALAND

THE University of New Zealand, with which, since 1874, the University of Otago has been affiliated, has, we are glad to find, adopted a quite modern schedule of subjects for its degree of B.A.

The subjects of examination for the B.A. degree are:—1. Greek Language and Literature. 2. Latin Language and Literature. 3. English Language and Literature. 4. Modern Languages and Literature. 5. General History and Political Economy. 6. Jurisprudence and Constitutional History. 7. Mathematics. 8. Physical Science, any two of the following branches: (*a*) Sound and Light, (*b*) Heat and Radiant Heat, (*c*) Electricity and Magnetism, (*d*) Astronomy and Meteorology. 9. Chemistry. 10. Natural Science, any one of the following branches: (*a*) Geology and Mineralogy, (*b*) Zoology, (*c*) Anatomy and Physiology, (*d*) Botany. 11. Mental Science. No candidate shall be approved by the examiners unless he show a competent knowledge of at least five of the above subjects of examination, of which two must be Latin and Mathematics. The examination may be passed in two sections. Either two or three subjects of examination, one of which must be either Latin or mathematics, shall constitute the first section, which may be taken at the end of the second or any subsequent year, and the remaining subjects shall constitute the second section, which may be taken at the end of the third or any subsequent year; or, at the option of the candidate, all the subjects may be taken together at the end of the third or any subsequent year.

In this curriculum the physical and natural sciences seem to have a fair share allotted to them, and the same is also the case in the courses for the senior scholarships and honours—which latter cannot be competed for until the end of one year after the candidate takes his B.A. degree. A Bachelor of Arts obtaining honours can have his M.A. degree without special examination; all others have to pass an M.A. examination.

It is probable that for some time to come there will be great differences of opinion as to how the natural sciences should be taught and examined in in our universities. Some incline to limit the courses in botany and zoology, and to require a good sound knowledge of the prescribed work; others imagine that the effect of limiting a course is to produce a specialist, which, they argue, is to spoil a student; but the mean appears to us to be not so hard to find. A sound general knowledge of development and of physiology might certainly be demanded of all students, and the field of biology being too large for any human being to work over, the student might, as to details of structure, &c., be limited to the study of some defined class. It is in this direction evidently that Prof. Hutton has framed the schedule of zoology and botany, a schedule which, while we acknowledge it to be excellent from a general point of view, is, we are firmly persuaded, longer and more profound than is expedient in a new country, where the teaching power is not great. We are fully aware that there is a tendency in classical and mathematical teachers to believe that the study of natural science is something quite easy; but those able to judge have long agreed that not only does this study call for all the best talents, but that the student too often approaches it long after the impressionable period of his life: a little Latin, perhaps less Greek, a schoolboy knows; arithmetic, algebra, and geometry he is fairly familiar with; but the natural sciences and the how he lives, moves, and has his being, of these he is fain to exclaim, But who are ye? The professors of natural science must bide their time; it is no doubt coming, for biology is now somewhat taught in our schools, and may be will be taught on the mother's knee; but in the meanwhile let them not exact too much from candidates for B.A. degrees or honours; let them progress surely, even though they be accused of progressing slowly. As to the New Zealand University, we shall follow its progress with pleasure, and trust it may soon fulfil the great expectations that we have of it.

DOCTORED WINES

THE French Government have just passed a most salutary measure, which will have for effect the diminution, if not the complete suppression, of the process known as *plâtrage*, now become an almost constant custom through most of the wine districts of France, and which, from having at first been performed on a very moderate scale, has lately enormously increased, till it has developed into a crying abuse. The *plâtrage* is carried on during the fermentation, and consists in merely sprinkling the grapes, as successive baskets of them are emptied into the fermentation vats, with plaster of Paris —calcium sulphate—(French, *plâtre*), mineralogically known as gypsum, or selenite, in fine powder. Now the grape-juice contains several salts of potash, among which the most abundant are the tartrate and bi-tartrate, and these decompose when placed in contact with the calcium sulphate, forming calcium tartrate—an insoluble salt—and potassium sulphate.

In the case of potassium bi-tartrate, potassium bi-sulphate is formed. Now besides the salts of potash above named, the juice of the grape contains grape-sugar, a nitrogenous fermenting principle and an astringent principle—to which latter new red wines owe much of their harshness—and also a red colouring-matter, with which the astringent principle is intimately associated. The fermentation splits up the grape-sugar, as it is well known, into carbonic acid, which escapes with effervescence, and alcohol, which remains dissolved. In pure undoctored wines, in proportion to the development of alcoholic strength, and as the wine by age tends to become more acid, potassium bi-tartrate separates as a crystalline precipitate, forming the chief constituent of the deposit in the casks known as *lees*, or, when it forms in bottled wines, as the *crust*.

Now the astringent principle which in the red grape is, as we have explained, intimately combined with the colouring-matter, seems to be held more or less in solution by the tartrates, and as these subside with age the wine grows less harsh, losing at the same time much of its colour, and is said to ripen or grow mellow. As the astringent principle however disappears, the wine, if it be one of the weaker French wines, tends to run to the acetous fermentation, and this is why we frequently find a wine become sour and unpalatable shortly after it has mellowed with age and arrived at its maximum of perfection. Many a bin of valuable claret or Burgundy has thus suddenly surprised and disappointed its possessor, changing in the short space of a few months from fine mellow wine to undrinkable vinegar.

Now, as stated above, calcium sulphate (*plâtre*) decomposes the potassium tartrates, and by withdrawing them and substituting the potassium sulphate, tends to prevent much of the colouring and astringent matter from passing into solution, so that this so-called *plâtrage* is nothing more than a means employed by the Bordelais and Burgundians for giving to their wines a fictitious effect of age, and they naturally defend a practice which enables them to bring their wines sooner into the market, economising their outlay in casks, and diminishing the chances of loss entailed by keeping a large stock of wine on hand. Further the process lends itself to fraud, permitting the wine merchants of Bordeaux and Burgundy to import the strong harsh wines of the north of Spain and the south-east of France, which, when blended with the small, poorer wines of the hill-districts of their own country, and then being *plâtrés* (that is agitated with powdered calcium sulphate), become mild and palatable. Thousands of hogsheads of wines thus blended and doctored are annually sold, and too often at the high rates commanded by pure vintage wines. Under the provisions of the new act no wine is allowed to be brought into commerce if it contains over two grammes of potassium sulphate per litre. Even this proportion is too large, *plâtrage* should be entirely prohibited; but when we consider that wines are now often sold with five or six grammes of this salt to the litre, it was time indeed that some measures should be taken. The merchants defend themselves on the basis of the practice being innocuous, and that while it promotes the keeping qualities of the wine, even four grammes of potassium sulphate could do no harm. It is the greatest possible mistake to fancy that *plâtrage* makes wine keep; for, no the contrary, it withdraws from it the astringent principle, a most potent means of its preservation. For a Bordeaux merchant to contend that forty grains of potassium sulphate to the pint of wine is not or cannot be unwholesome, is a thesis which may be agreeable to his pocket, but certainly ought to be discouraged, for, to say the least, it would surely be prejudicial to the stomachs of delicate or dyspeptic consumers. Not very many years since a case occurred of actual death by poisoning from the administration of a comparatively small dose of potassium sulphate, and this salt is well known in medicine as a drastic and dangerous purgative. We should then be most sincerely grateful to the French Minister of Commerce for the prudent forethought with which he has protected the consumers of French wines from a practice which had grown into a crying abuse, and for giving us one more guarantee for the purity of these wines, justly ranked as the most esteemed that the world produces.

MULTIPLE SPECTRA[1]

III.

I HAVE endeavoured to show in the previous articles that there are many facts which justify the conclusion that the same elementary substance in a state of purity can under different conditions give us spectra different in kind. To those spectra to which special reference is now made the names of *lined* and *fluted* have been given to mark their chief point of difference, which is that in lined spectra we deal with lines distributed irregularly over the spectrum; while in fluted spectra we deal with rythmical systems.

This was the first point, and I showed that the idea was suggested that the lined and fluted spectra, though produced by the same substance, were produced by that substance in a different molecular condition.

I have pointed out that both in lined and fluted spectra taken separately there was evidence of still further complication, that is, that a complete lined spectrum of a substance and a complete fluted spectrum of a substance, was the result of the vibration not of one kind of molecule only, but probably of several.

So that in this view we have to imagine a series, in some cases a long series, of molecular simplifications brought about by the action of heat, and ascribe the spectral changes to these simplifications.

To understand my contention, and one objection which has been taken to it, in the clearest way, let us suppose that there is a substance which gives us, under different conditions, three spectra, which we will term *a*, *b*, and *c*. My view is that these spectra are produced by three distinct molecular groupings brought about by successive dissociations. On the other hand, it is objected that they are produced by *one and the same molecule* struck, as a bell might be struck, *in different ways* by the heat waves or the electric current passing among the molecules.

In my memoir entitled "Discussion of the Working Hypothesis that the so-called Elements are Compound Bodies," I remarked as follows:—

"I was careful at the very commencement of this paper to point out that the conclusions I have advanced are based upon the analogies furnished by those bodies which, by common consent and beyond cavil and discussion, are compound bodies. Indeed, had I not been careful to urge this point, the remark might have been made that the various changes in the spectra to which I shall draw attention are not the results of successive dissociations, but are effects due to putting the same mass into different kinds of vibration or of producing the vibration in different ways. Thus the many high notes, both true and false, which can be produced out of a bell with or without its fundamental one, might have been put forward as analogous with those spectral lines which are produced at different degrees of temperature with or without the line, due to each substance when vibrating visibly with the lowest temperature. To this argument, however, if it it were brought forward, the reply would be that it proves too much. If it demonstrates that the *h* hydrogen line in the sun is produced by the same molecular grouping of hydrogen as that which gives us two green lines only when the weakest possible spark is taken in hydrogen inclosed in a large glass globe, it also proves that calcium is identical with its salts. For we can get the spectrum of any of the salts alone without its common base, calcium, as we can get the green lines of hydrogen without the red one.

"I submit, therefore, that the argument founded on the over-notes of a sounding body, such as a bell, cannot be urged by any one who believes in the existence of any compound bodies at all, because there is no spectroscopic break between acknowledged compounds and the supposed elementary bodies. The spectroscopic differences between calcium itself at different temperatures is, as I shall show, as great as when we pass from known compounds of calcium to calcium itself. There is a perfect continuity of phenomena from one end of the scale of temperature to the other."

Not only is what may be termed the bell hypothesis opposed to the law of continuity, as I endeavoured to show in the last paragraphs quoted, but it appears never to have struck the objectors that it is also opposed to the theory of exchanges as it is generally enunciated, on which the whole of our supposed knowledge of extra-terrestrial matter depends. If vapours, when relatively cool, do not absorb the same wave-lengths which they give out when relatively hot, what becomes of some of the most noted exploits of our nineteenth-century science?

Take the case of sodium. Three distinct spectra have been mapped for it. There is first the yellow line seen in a Bunsen flame, then the green line seen alone in a vacuum tube when the vapour is illuminated by an electric glow, and again there is the fluted absorption spectrum, without any lines, seen when sodium is gently heated in hydrogen in a glass tube. If we have here the same molecule agitated in different ways, I ask which is the true spectrum of sodium? And what right have we to say that sodium exists in the sun because the yellow line is represented? Why do we not rather say that sodium does *not* exist in the sun because the fluted spectrum is *not* represented.

It is not necessary to enlarge upon this point because the difficulty in which the theory of exchanges is thus landed is obvious, while, if we acknowledge different molecular groupings in the vapours of the same chemical substance, and apply the theory of exchanges *to each grouping*, then the teachings of that theory become more numerous and important than before.

It is of course of the highest importance to see whether there is any *experimentum crucis*—any mode of inquiry—by which the theory can be settled one way or the other.

I submit that the results of experiments based on the following considerations ought to be accepted as throwing light on the question.

1. At different temperatures the brilliancy of the spectral lines of the same substances as ordinarily observed changes enormously. See if these changes can be produced *at the same temperature* by employing those experimental conditions which will be most likely to bring about different molecular conditions if such exist.

2. At a low temperature some substances give us few lines while at a high one they give us many. Vapours, therefore, already glowing with few lines at a low temperature, say in a flame, should give us all their lines when the vapour is suddenly subjected to a high one, say by the passage of a high tension spark. On the bell hypothesis the spectrum should change with the mode of striking. On the dissociation hypothesis this should only happen for the lines of those molecular groupings which are *from other considerations* held to be more simple. If the flame has brought the substance to its lowest state, the passage of the most powerful spark should not cause the flame spectrum to vary.

Now what are the "other considerations" above referred to? This necessitates a slight digression.

In the *Phil. Trans.* for 1873[1] I gave an historical account, showing how, when a light source such as a spark or an electric arc is made to throw its image on the slit of a spectroscope, the lines had been seen of different lengths, and I also showed by means of photographs how very definite these phenomena were. It was afterwards demonstrated that for equal temperatures chemical combination or mechanical mixture gradually reduced the spectrum by subtracting the shortest lines, and leaving only the long ones.

---

[1] Continued from p. 312.

[1] *Phil. Trans.*, 1873, p. 254.

On the hypothesis that the elements were truly elementary, the explanation generally given and accepted was that the short lines were produced by a more complex vibration imparted to the "atom" in the region of greatest electrical excitement, and that these vibrations were obliterated, or prevented from arising, by cooling or admixture with dissimilar "atoms."

Subsequent work, however, has shown[1] that of these short lines *some* are common to two or more spectra. These lines I have called basic. Among the short lines, then, we have some which are basic, and some which are not.

The different behaviour of these basic lines seemed, therefore, to suggest *that not all of the short lines of spectra were, in reality, true products of high temperature.*

That some would be thus produced and would therefore be common to two or more spectra we could understand by appealing to Newton's rule: "Causas rerum naturalium non plures admitti debere quam quæ et veræ sint et earum phænomenis explicandis sufficiant," and imagining a higher dissociation. It became, however, necessary to see if the others would also be accounted for.

Now if not all but only *some* of the short lines are products of high temperature, we are bound to think that the *others* are remnants of the spectra of those molecular groupings first to disappear on the application of heat.

At any particular heat-level, then, some of the short lines may be due to the vibrations of molecular groupings produced with difficulty by the temperature employed, while others may represent the fading out of the vibrations of other molecular groupings produced on the first application of the heat.

In the line of reasoning which I advanced a year ago,[2] both these results are anticipated, and are easily explained. Slightly varying Fig. 2 of that paper, we may imagine furnace A to represent the temperature of the jar spark, B that of the Bunsen burner, and C a temperature lower than that of the Bunsen burner (Fig. 1).

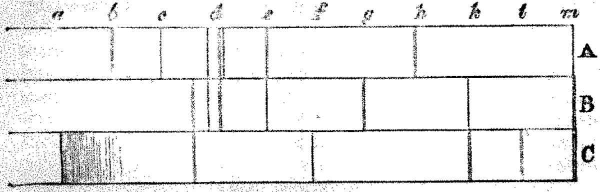

FIG. 1.—A. Highest temperature. C. Lowest temperature.

Then in the light of the paper the lines *b* and *c* would be truly produced by the action of the highest temperature, *c* would be short and might be basic, while of the lines *h* and *m*, *m* would be short and could not be basic, because it is a remnant of the spectrum of a lower temperature.

So much then by way of explanation; it is clear that to make this reasoning valid we must show that the spark, or better still the arc, provides us with a summation of the spectra of various molecular groupings into which *the solid metal which we use as poles* is successively broken up by the action of heat.

We are not limited to solid metals; we may use their salts. In this case it is shown in the paper before referred to[3] that in very many cases the spectrum is one much less rich in lines.

The experimental work has followed two distinct lines. I shall refer somewhat in detail to the results obtained along each. The first relates to the extraordinary and beautiful phenomena and changes observed in the spectra of vapours of the elementary bodies when volatilised at different temperatures in vacuum tubes. Many of the lines thus seen alone and of surpassing brilliancy, are those seen as short and faint in ordinary methods of observation, and the circumstances under which they are seen suggest, if we again apply Newton's rule, that many of them are produced by complex molecules.

In this case the appeal lies to the phenomena produced when organic bodies are distilled at varying temperatures; the simplest bodies in homologous series are those volatilised at the lowest temperatures; so that on subjecting a mixture of two or more liquids to distillation, at the beginning a large proportion of the more volatile body comes over, and so on.

The novelty of the method consists in the use of the luminous electric current as an explorer and not as an agent for the supply of the vapours under examination; that is to say, the vapours are first produced by an external source of heat, and are then rendered luminous by the passage of the current. The length and bore of the tube therefore control the phenomena to a certain extent.

A form of apparatus which I have found to answer very well is shown in the accompanying woodcut (Fig. 2).

A is the tube or retort containing the metal experimented on in its lower extremity, and having a platinum wire sealed into it at a distance of about two inches from the lower end, the other end being drawn out and connected by a mercury joint to an ordinary Geissler tube, which is connected by another mercury joint to the Sprengel pump C.

Another form of tube which I have used is prepared by inserting two platinum poles into a piece of combustion tubing sealed at one end, and after inserting the metal to be experimented on, drawing out the glass between the platinums to a capillary tube.

I have also tried inserting the platinum pole at the end of the retort, so that the spark passes from the surface of the metal, but this arrangement did not answer at all.

Some other modifications have been tried, but the first form I have described is that which I have found to answer best, so far as the trials have yet gone.

D is the spectroscope.

E is the lens used for focussing the image of the Geissler tube on the slit.

F is the spirit lamp for heating the retort.

H is the battery.

K and L are the wires connected with the coil.

In the second cut (Fig. 3) the method of observing the spectrum of the vapours close to the surface of the metal is indicated; the same letters apply, D′ being, however, in this case a direct-vision spectroscope, which was sometimes employed for convenience.

For determining the exact positions of the lines in the spectrum of the vapour in any part of the retort, a larger spectroscope, with its illuminated scale, was used in the place of the direct-vision spectroscope.

The secondary wires of the coil were connected, one with the pole in the upper bulb at B, and the other with the platinum at A.

B is an ordinary Geissler tube with two bulbs separated by a capillary tube. The great advantage of this arrangement is that this capillary portion can be used for ascertaining what gases or vapours are carried over by the pump without any interference with the retort, both wires being connected with the Geissler tube. If, for example, we are working with sodium which contains an impurity of hydrocarbon, the moment at which it begins or ceases to come off can be found by examining the spectrum of this capillary tube.

I now give an account of the phenomena observed when we were working with sodium, in order to show the kind of phenomena and the changes observed.

After a vacuum has been obtained the retort is heated gradually. The pump almost immediately stops clicking, and in a short time becomes nearly full of hydrogen. The spectrum of the capillary then shows the hydrogen lines intensely bright. After some time the gas comes off far less freely, and an approach to a vacuum is again obtained. Another phenomenon now begins to show itself: on passing the current a yellow glow is seen, which gradually fills the whole space between the pole in the retort and the metal; its spectrum consists of the lines of hydrogen and the yellow line of sodium, the red and green line being both absent until the experiment has gone on for some time.

---

[1] *Proc. R.S.*, vol. xxviii. p. 159. [2] *Proc. R.S.*, vol. xxviii. p. 162. [3] *Phil. Trans.*, 1873, p. 258.

As the distillation goes on, the yellow glow increases in brilliancy, and extends to a greater distance above the pole, and the red and green lines presently make their appearance as very faint lines.

The upper boundary of the yellow is quite sharp, the lines and fluted spectrum of hydrogen appearing above it.

After the yellow glow-giving vapour (which does not attack the glass) has been visible for some time, the pump is stopped and the metal *heated more strongly*. On passing the current a little while afterwards, a very brilliant leaf-green vapour is seen underlying the yellow one, and connected with it by a sap-green vapour. The spectra then visible in the tube at the same time are—

Leaf-green ...	Green and red lines of sodium and C of hydrogen; D absent.
Sap-green	Green, red, and yellow sodium lines of equal brilliancy and C of hydrogen.
Yellow	D alone and C.
Bluish-green ...	C and F and hydrogen structure.

To observe the green sodium line alone it is necessary to point the direct-vision spectroscope just above the surface of the metal where the green is strongest. It is also necessary to guard against internal reflections from the glass, as this may sometimes cause the D line to be seen by reflection from the surface.

This method of inquiry has been tried also with potassium, calcium, and some other metals, and with metallic salts.

With potassium and calcium we get the same inversion of phenomena, the yellow-green lines of potassium being seen without the red, while in the case of calcium the blue line alone was seen.

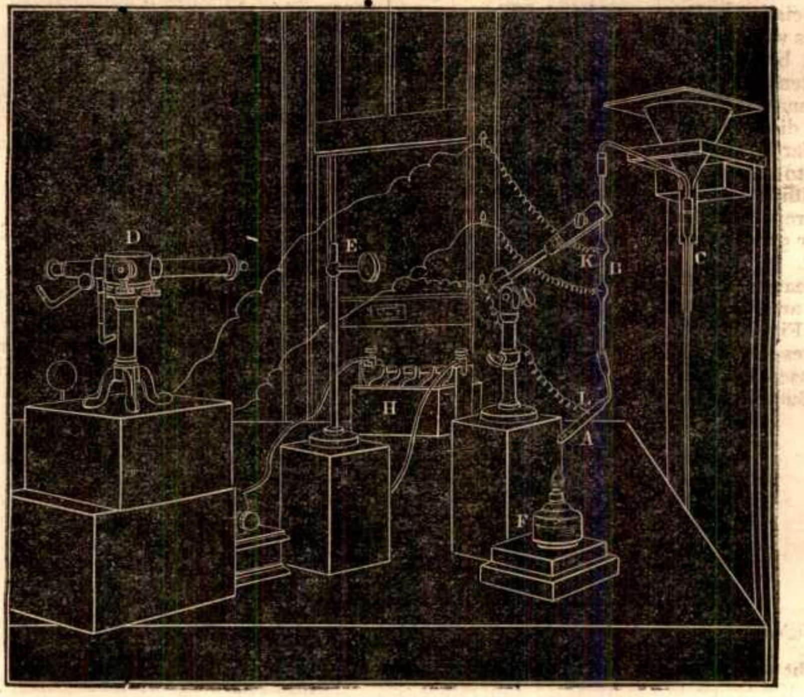

Fig. 2.—Distillation Apparatus.

The fact that in these experiments we get, as before mentioned, vapours which at one and the same time exhibit different colours and different spectra at different levels in the tube, at once suggests the phenomena of fractional distillation.

It is also suggested, as a result of the application of this new method, that in the case of a considerable number of chemical substances not only the line spectrum is compound in its origin, as I suggested many years ago, but that a large number of the lines is due to molecular groupings of considerable complexity, which can be kept out of the reaction by careful low temperature distillation.

So much then for one method. Now for the other.

In this I have attempted to gain new evidence in the required direction by adopting a method of work with a spark and a Bunsen flame, which Col. Donnelly suggested I should use with a spark and an electric arc. This consists in volatilising those substances which give us flame spectra in a Bunsen flame and passing a strong spark through the flame, first during the process of volatilisation, and then after the temperature of the flame has produced all the simplification it is capable of producing.

The results have been very striking; the puzzles which a comparison of flame spectra and the Fraunhofer lines has set us find, I think, a solution; while the genesis of spectra is made much more clear.[1]

To take an instance, the flame spectrum of sodium gives us, as its brightest, a yellow line, which is also of marked importance in the solar spectrum. The flame spectra of lithium and potassium give us, as their brightest, lines in the red which have not any representatives among the Fraunhofer lines, although other lines seen with higher temperatures are present.

Whence arises this marked difference of behaviour?

---

[1] I allude more especially to the production of triplets, their change into quartets, and in all probability into flutings, and to the vanishing of flutings into lines, by increasing the rate of dissociation.

From the similarity of the flame spectrum to that of the sun in one case, and from the dissimilarity in the other, we may imagine that in the former case—that of sodium—we are dealing with a body easily broken up, while lithium and potassium are more resistant; in other words, in the case of sodium, and dealing only with lines recognised generally as sodium lines, the flame has done the work of dissociation as completely as the sun itself. Now it is easy to test this point by the method now under consideration, for if this be so then (1) the chief lines and flutings of sodium should be seen in the flame itself, and (2) the spark should pass through the vapour after complete volatilisation has been effected without any visible effect.

Observation and experiment have largely confirmed these predictions. Using two prisms of 60° and a high-power eyepiece to enfeeble the continuous spectrum *of the densest vapour produced at a high temperature*, the green lines, the flutings recorded by Roscoe and Schuster, and another coarser system of flutings, so far as I know not yet described, are beautifully seen. I say largely, and not completely, because the double red line and the lines in the blue have not yet been seen in the flame, either with one, two, or four prisms of 60°, though the lines are seen *during volatilisation* if a spark be passed through the flame. Subsequent inquiry may perhaps show that this is due to the sharp boundary of the heated region, and to the fact that the lines in question represent the vibrations of molecular groupings more complex than those which give us the yellow and green lines. The visibility of the green lines, *which are short*, in the flame, taken in connection with the fact that they have been seen alone in a vacuum tube, is enough for my present purpose.

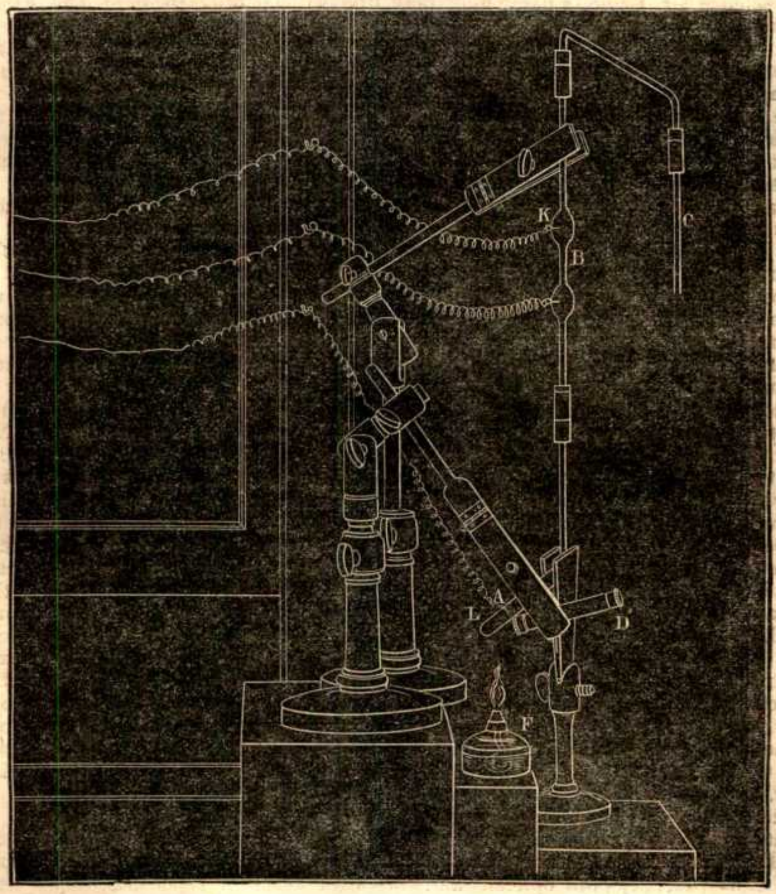

FIG. 3.—Position of Spectroscope for discovering Vapours close to the Metal.

With regard to the second point, the passage from the heat-level of the flame to that of the spark after volatilisation is complete, produces no visible effect, indicating that in all probability the effects heretofore ascribed to *quantity* have been due to the presence of the molecular groupings of greater complexity. *The more there is to dissociate, the more time is required to run through the series, and the better the first stages are seen.*

J. NORMAN LOCKYER

(*To be continued.*)

WILLIAM LASSELL, LL.D., F.R.S.[1]

THE scientific world will receive with deep regret the intelligence of the death of this distinguished astronomer. The smaller circle of those who knew Mr. Lassell personally will deplore the loss of a friend of rare worth. Mr. Lassell passed away without suffering soon after five o'clock on the morning of Tuesday, October 5, in the eighty-second year of his age, full of years and greatly honoured and respected.

In the words of Sir John Herschel, Mr. Lassell "belonged to that class of observers who have created their own instrumental means, who have felt their own wants and supplied them in their own way." The qualities which enabled Mr. Lassell to do all this made him what he was. The work was the revelation of the man. He felt precisely where lay the difficulties and wants which met him in his work, because he was sensitive and sympathetic. He could deal successfully with these difficulties, and supply these wants, often in a masterly and original way, because he could think for himself cautiously and yet boldly. He could work out his conceptions in new and difficult directions to a successful issue, because the constancy of his character showed itself here in concentration of thought and perseverance of action. These qualities, sensitive sympathy, wise prudence, constancy, were those which pre-eminently characterised him as a man and a friend.

---

[1] Based on an obituary notice written by the present writer for the *Times*.

In the history of science Mr. Lassell's name must rank with those of Herschel and the late Lord Rosse in connection with that essentially British instrument, the reflecting telescope, whether we consider the genius and perseverance displayed in the construction of these instruments, or the important discoveries which have resulted from their use. About 1820 Mr. Lassell, then in his twenty-first year, began to construct reflecting telescopes for himself. It is perhaps to circumstances which Mr. Lassell at the time considered most unfavourable that science is indebted for much that Mr. Lassell has accomplished. At that time he did not possess sufficient means to enable him to purchase expensive instruments, and besides "his business avocations were such as most men consider of an engrossing nature." The value to him in his subsequent work of the energy and power of resource which were in this way so strongly developed in his character at an early age it is difficult to appraise. His success with the two first instruments which he attempted simultaneously, a Newtonian of 7-inch diameter and a Gregorian of the same size, encouraged him to make a Newtonian of 9-inches aperture. The several mirrors made for this instrument were of great excellence. The observatory note-books of the late Mr. Dawes, which are in the writer's possession, bear record to the delicate tests for figure to which these mirrors were put on the occasions of the visits of Mr. Dawes to the observatory of his friend at Starfield, near Liverpool, where the instrument was erected.

The instrument may be said to form an epoch in the history of the reflecting telescope, in consequence of the successful way in which Mr. Lassell, on a plan of his own, secured to it the inestimable advantage of the equatorial movement.

About 1844 Mr. Lassell conceived the bold idea of constructing a reflector of 2 feet aperture and 20 feet focal length, to be mounted equatorially on the same principle. Mr. Lassell spared neither pains nor cost to make this instrument as perfect as possible, both optically and for the mechanical side. As a preliminary step he visited the late Earl of Rosse at Birr Castle, and commenced the specula for this instrument with a machine similar in construction to that employed by that nobleman. After some months work he was not satisfied with this apparatus, and was led, in consequence, to contrive a machine for imitating as closely as possible those motions of the hand by which he had been accustomed to produce perfect surfaces on smaller specula. "The essential difference of these constructions," to use the words of Sir George Airy, "as regards the movements of the grinder is this: that in Lord Rosse's apparatus every stroke is very nearly straight, while in Mr. Lassell's apparatus there is no resemblance to a straight movement at any part of the stroke." This is not the place to describe the many new contrivances in the mode of support of the mirror, in the equatorial mounting, and in the polishing machine, which enabled Mr. Lassell to bring this instrument to a high degree of perfection. I must not omit to notice, to use Sir John Herschel's words, "that in Mr. Nasmyth he was fortunate to find a mechanist capable of executing in the highest perfection all his conceptions, and prepared by his own love of astronomy and practical acquaintance with astronomical observation, and with the construction of specula, to give them their full effect." Mr. Lassell was very successful in the great brilliancy and permanency of polish of his metal. Within the last few years the writer has been shown specula by Mr. Lassell which had not been polished for more than twenty years, and which appeared as bright as if but just removed from the polishing machine.

With this fine instrument he discovered the satellite of Neptune. This minute body was first seen on October 10, 1846, but it was not until the next year that it could be satisfactorily followed and its existence fully confirmed.

The superiority of the telescope and the vigilance and skill of the observer were further shown by the discovery in 1848, simultaneously with Prof. Bond in America, of an eighth satellite of Saturn, of extreme minuteness, which was named Hyperion.

In 1851, after long and careful search, he discovered two additional satellites of the planet Uranus (Umbriel and Ariel), anterior to the two discovered by Sir W. Herschel in 1787. In the autumn of 1852 he took his 20-foot telescope to Malta, and observed through the winter of that year.

A most careful drawing of the nebula of Orion and drawings of several planetary nebula will be found in vol. xxiii. of the *Memoirs* of the Royal Astronomical Society. With respect to the planets, to use his own words, "his discoveries were rather negative than otherwise," for he was satisfied that without great increase of optical power no other satellite of Neptune could be detected. With regard to Uranus he says, "I am fully persuaded that either he has no other satellites than the four, or if he has they remain yet to be discovered."

Mr. Lassell's energy and zeal in the cause of science did not permit him to remain content with this magnificent instrument. His last work was a much larger telescope, four feet in aperture and thirty-seven feet focus, mounted equatorially. This grand instrument was erected at Malta in 1861, and the work done with it, with Mr. Marsh's assistance during the next four years, is fully described in vol. xxxvi. of the *Memoirs*. This work consists of numerous observations of nebulæ and planets and a catalogue of the places of 600 new nebulæ discovered at Malta. It is not possible to suppress a feeling of regret that this magnificent instrument no longer exists.

After his return from Malta Mr. Lassell purchased an estate near Maidenhead, and erected in an observatory his equatorial telescope of 2-feet aperture. Mr. Lassell's experience in repolishing his 4-feet mirrors suggested to him some alterations in his polishing machine. After his return he was able to carry out these experiments in a workshop erected at Maidenhead, and succeeded in constructing an improved form of polishing machine, which is described in the *Transactions* of the Royal Society for 1874. In 1839 Mr. Lassell was elected a Fellow of the Royal Astronomical Society, received its gold medal in 1849, and in 1870 was elected its president, which office he held for two years. He became a Fellow of the Royal Society in 1849, and received one of its gold medals in 1858. Among other honours conferred upon him may be mentioned an honorary degree from the University of Cambridge, and the honorary Fellowships of the Royal Societies of Edinburgh and Upsala.

The numerous papers by Mr. Lassell to be found in the *Monthly Notices* and the *Memoirs* of the Royal Astronomical Society bear abundant record to his industry and skill, and make us feel that in Mr. Lassell's death we have to deplore the loss of one who contributed largely to the advancement of the science of his age.

William Huggins

NOTES

ANOTHER brilliant synthesis has recently been accomplished in the domain of organic chemistry; Messrs. Grimaux and Adam have succeeded in building up citric acid from glycerin. We shall give full details next week. Curiously enough, in the last number of the Berlin *Berichte*, Kekulé announces that he has been working at the same subject, but by a totally different method. Kekulé's work is not sufficiently advanced for him to say positively that his method of synthesis is successful, but he feels justified in saying that very probably the process adopted by him has resulted in the formation of citric acid.

THE death is announced of Dr. Hofrath von Wagner, Professor of Technological Chemistry in the University of Würzburg, and the author of several works on that science, chief of which is "Jahresberichte über Chemische Technologie" and "Handbuch der chemischen Technologie," translated into English by Mr. Crookes. He was born at Leipsic in 1823, and first taught in Nüremberg.

THE credit of the invention of binocular glasses has usually been assigned to a certain Bohemian friar, Father de Rheita, who died at Ravenna in 1660. His treatise, which bears the quaint title of "Oculus Enochi et Eliæ," was published at Antwerp in 1645. In 1677 there appeared at Paris a volume entitled "La Vision parfaite," by another ecclesiastic, Père Cherubin of Orleans, which contained an account of some improvements on de Rheita's discovery, illustrated by excellent copper-plate engravings. Lately however Signor Govi has unearthed in the Bibliothèque nationale a printed document which proves the antiquity of binocular glasses to be a little more remote. This document is a placard by one D. Chorez of Paris, who lived on the island of Nôtre-Dâme, at the sign of the "Compas." The placard is in old French, and is headed "Av Roy"; it states that the "admirable lunettes" it describes, and which are represented by accompanying figures, were invented by Chorez and dedicated to the king in 1625.

IN the placard of the optician Chorez referred to, the address actually printed was "la rue de Perigneur aux Marais du Temple"; but these words have been struck out with a pen, and above is written "Lisle nostre Dame." The incident is curious as showing that two centuries and a half ago the same quarters of Paris were frequented as now by the instrument-maker. M. Salleron is in the Rue Parée du Marais; M. Lemaire a little farther north, just out of the *Quartier du Temple*, in the Rue Oberkampf. On the island of Nôtre-Dâme the opticians elbow one another in shoals, not to omit M. Bregnet's modest shop. The only district of Paris which can, indeed, compete with these being the *Quartier Latin*, where instrument-makers of all kinds abound.

WITH regard to the announcement in an enterprising provincial contemporary of a projected "Natural History Survey of India," the general conduct of which is to be intrusted to Dr. George King of the Botanical Gardens, Calcutta, we believe that those most concerned know nothing which affords any foundation for the statement. The notion is intrinsically improbable, inasmuch as the "Flora of British India," which is in process of preparation at Kew, and of which the third volume is now in course of publication, covers the same ground. It would be inexpedient for the Government to take any step of the kind as far as botany is concerned till the material collected by Indian botanists since the beginning of the century has been fully worked up, and this is being rapidly proceeded with under the direction of Sir Joseph Hooker, assisted by Mr. C. B. Clarke of the Bengal Education Department, who has been detached on duty at Kew for the purpose.

THE case recently reported in the newspapers of poisoning by American tinned beef is calculated to arouse much alarm in the minds of those who use tinned meats. According to the newspaper report of the inquest, no direct evidence was given that poisoning was actually due to zinc or other metallic poison; in the present state of knowledge the explanation referred to by Mr. Dyer in his letter to the *Daily News*, viz., that it was due to the unwholesome state of the meat itself, and not to metallic poison absorbed from the tin, seems the most probable. Nevertheless, a series of well-conducted experiments, undertaken by some of the companies whose trade in these meats is so large, on the action of meat juices on tin and on solder, might do much to allay suspicion, and at the same time to advance our knowledge of natural facts.

IN the last session of the United States Congress at Washington, May 24, 1880, the "Committee on Naval Affairs" reported a bill in support of a proposed International Commission to agree upon standard tests for colour-blindness and visual power in navies and merchant marines, and standard requirements of these faculties. Resolutions in recommendation of this Commission have been passed by the American Ophthalmological Society at their Newport meeting, the Ophthalmological Section of the British Medical Association at Cambridge, and the International Congress of Ophthalmology at Milan. The next United States Congress will act on this bill to initiate the Commission. Dr. R. Joy Jeffries, 15, Chestnut Street (Beacon Hill), Boston, Mass., U.S. America, intimates that he will be greatly indebted for any public or private statistics or information in relation to this subject which any one can send him.

MR. ADAM SEDGWICK, who was elected a Fellow of Trinity College, Cambridge, on Saturday last, the 9th inst., graduated in the First Class of the Natural Sciences Tripos of 1877, when he was especially distinguished for his knowledge of zoology and comparative anatomy, human anatomy and physiology. Those of our readers who are interested in the study of the principle of heredity may be glad to know that this gentleman is the great-nephew and eldest male representative of the illustrious geologist whose name he bears.

IN reference to our note (NATURE, vol. xxii. p. 541) upon the awards of the juries of the Exhibition of Agriculture and Insectology at Paris, wherein we observed that a suggestion had been put forward to arrange the electric light as an insect-catcher, a correspondent writes that in experimenting for other purposes with a Browning electric light upon a roof at Charing Cross, besides innumerable flies and moths, single individuals of two species of sphinxes were attracted, probably from considerable distances.

THE Freedom of the City of London was conferred on Sir Henry Bessemer on Wednesday last week. Sir Henry in his address indicated the vast improvements which his process had introduced in the manufacture of steel, and at the dinner in the evening he sketched the early progress of iron manufacture.

THE French Minister of Public Instruction has caused an edition of Mr. Herbert Spencer's work on Education to be published for gratuitous distribution in France.

A PRACTICAL experiment was, on Wednesday last week, tried with the air-engine at Woolwich, designed by Col. Beaumont, Royal Engineers, and which has been for some time running on the short lines of the Royal Arsenal. Although weighing but 10 tons, it has proved capable of hauling a burden of 16 tons up a fair incline, and arrangements were made to try its powers in a more extended run, such as engines of the kind would have to encounter on the London railways and tramways. The air-reservoir, which contains only 100 cubic feet of air, was charged at the torpedo pumping-house, up to pressure of 1,000 lb. to the square inch, and with this store of energy it was proposed to run to and from Dartford, about 16 miles. The chief feature of Col. Beaumont's method is the introduction of an almost imperceptible supply of steam, by which the air, as it is admitted to the cylinder from the reservoir, is largely heated, and thereby greatly increased in force. The engine is driven by six cylinders and a double set of machinery at one end, and, having no smoke-stack, resembles in appearance a locomotive tender rather than a locomotive. It runs on four wheels, and in size is less than that of an ordinary omnibus. It left the Royal Arsenal at Plumstead Station at 12.22 p.m., with a full charge of 1,000 lb. to the inch, passed Abbey Wood Station at 12.27 with 940 lb. on the guage; Belvedere at 12.33, with 8.60 lb.; and Erith at 12.36, with 760 lb., arriving at Dartford at 12.50, with a remaining energy of 540 lb. on the square inch. Shunting about at the station reduced this pressure somewhat, and at 1·35 the return journey commenced with a store of 510 feet. Although the minimum for effective working is considered to be a pressure of 200 feet, Plumstead station was reached again at 2.10, but the engine was nearly pumped out, having a pressure of barely 80 lb. remaining. It was stated that another engine was being constructed, much more powerful; capable, in fact, of travelling double the distance with a single charge. The operation of pumping in the compressed air occupies about fifteen minutes, and it is calculated that an air engine on this principle as large as the usual steam locomotive of 50 tons weight would be considerably more powerful than any locomotive yet made. The objection to steam, that it frightens horses, cannot apply to this system, as there is no escape of steam visible or audible, and the only noise to be distinguished is a rumbling sound like the rattle of the street traffic.

One of the most satisfactory reports on the progress of cinchona cultivation and the harvesting of bark in the Government plantations in Bengal, has just been issued by Dr. King. A summary of the work of the year 1879-80 shows that the plantation was extended by about three-quarters of a million of young trees, a crop of 361,590 lbs. of dry bark was harvested, a new kind of cinchona, namely, that which yields the Carthagena bark of commerce, was brought into cultivation, and the nursery stock was maintained at a sufficiently high level for the supply of young plants for the present year. In the details of the year's planting it is shown that as in former years the species most largely planted was *C. succirubra*, and of this as many as 644,222 were put out. Of the valuable *C. calisaya* and hybrid plants a comparatively large number has been planted; of the hybrid species as many as 39,400 at Mungpoo, and 36,680 at Sittong, and of *C. calisaya* 12,782 at Sittong. The yield of bark during the year amounted to 361,590 lbs. of dry bark. Dr. King further reports that in accordance with the orders of Government arrangements were made towards the end of the year for sending a quantity of the Calisaya bark, which had accumulated in the factory store-room, to London for sale, and since the expiry of the year, part of this bark has actually been despatched: further it is stated that the amount of febrifuge used in substitution of quinine in Government hospitals and dispensaries during the past year was 5,400 lbs. Taking the average price in Calcutta of quinine for the year at Rs. 90 per lb. (a low estimate), the saving effected by this substitution has been very nearly four lakhs of rupees. The saving in former years from the substitution of the febrifuge having amounted to seven and three quarter lakhs of rupees, the total saving up to the end of last year therefore reaches eleven and three quarter lakhs, which is quite a lakh and a half more than the plantations (including compound interest at 4 per cent.) have cost since their commencement. This is a most satisfactory statement, added to which the introduction through Kew of the valuable species of cinchona, yielding Carthagena or Columbian bark, and the prospect of its successful propagation, makes Dr. King's present report one of very great interest and satisfaction.

We have received several numbers for the current year (vol. v.) of the *Botanical Gazette*, a Paper of Botanical Notes published at Crawfordsville, Indiana. The *Gazette* appears to have a large circulation in Western America, which, as far as we can judge from the specimens before us, it well deserves. We quote the following interesting and sensible remarks from the editorial notes:—"A new school of botanists is rapidly gaining ground in this country, and we are glad to see it. While the country was new and its flora but little known, it was very natural for systematic botany to be in the ascendency. It is a very attractive thing to most men to discover new species; but when the chance for such discovery becomes much lessened, there is a turning to the inexhaustible field of physiological botany. Systematists are necessary, but a great number of them is not an essential thing, and it is even better to have but a few entitled to rank as authorities in systematic work. But in studying the life-histories of plants or their anatomical structure, we cannot have too many careful observers. This, at the present day, seems to be the most promising field, and one botanist after another is coming to appreciate it. As microscopes are becoming cheaper, and hence commoner, the workers in the histology of plants are becoming more numerous, and it is to such that the *Gazette* would now address itself." We noticed especially some remarkable observations by a correspondent of the *Gazette* on the carnivorous habits of the honey-bee of South America. These would appear, however, to require confirmation before they can be accepted without hesitation.

The *Valley Naturalist* is the title of a small monthly journal published in St. Louis, U.S. It contains contributions in various departments of natural science; it would be of more value, we think, if it confined itself more strictly to contributions on local natural history, and had fewer miscellaneous items from foreign journals.

We noticed a few months ago that an international metrological office had been established at Breteuil (near St. Cloud) at the expense of all the civilised nations except England. A part of the duties of this office is to deliver to the associated nations approved standard metres and kilograms for the ulterior construction of other standards, and practical verification of the usual metres and kilograms. The standards intended for France being ready, the Minister of Public Instruction appointed the French national committee, which is composed of MM. Dumas, St.-Claire Deville, Hervé-Mangon, Mascart, and a few others. It may be noted that M. Tresca, who designed the pattern of the international metre adopted by the International Commission, is not one of the new committee.

The Nineteenth Century Building Society has done a commendable thing in resolving, that as, in their opinion a course of lectures at the Parkes Museum of Hygiene on House Sanitation would be most valuable to the members of building societies (who to a very large extent own the house they live in), the secretary of the society be requested to ask the Committee of the Museum whether such a course of lectures could not be given gratuitously during the ensuing winter.

The Municipal Council of St. Petersburg is at present deliberating on a proposition made by the Electrotechnik, a Russian society recently established, for illuminating with Siemens lamps the Newsky Prospect, whose length is 7,000 metres.

The Algerian *Akhbar* says, in one of its last numbers, that the corpses of two European travellers, who according to all probability have died from want of water, have been discovered lying in the desert fifty miles southward of Wargla, the most remote oasis occupied by the French in the Algerian Sahara.

The names and nationality of these two unfortunate travellers have not been ascertained yet, according to our contemporary.

FROM a Japan paper we learn that at the Botanical Garden in Aichi *ken*, an Indian tea-plant, has been planted as an experiment. The leaves have lately been gathered and treated in the same manner as the Uji tea, and it has been found that the product of dried tea is greater in proportion to the quantity of leaves used than in the case of Japanese plants. Tea-growers are, in consequence, said to be devoting their attention to the new plant.

THE additions to the Zoological Society's Gardens during the past week include a Plantain Squirrel (*Sciurus plantani*) from Java, a Smooth Snake (*Coronella lævis*) from Hampshire, presented by Mr. D. Tober; a Plantain Squirrel (*Sciurus plantani*) from Java, presented by Mrs. Elliot; a Common Spoonbill (*Platalea leucorodia*), European, presented by Mr. W. H. St. Quintin; a Common Kestrel (*Tinnunculus alaudarius*), European, presented by Mr. J. Young; two Central American Agoutis (*Dasyprocta isthmica*) from Central America, a Variable Squirrel (*Sciurus variabilis*), a Common Boa (*Boa constrictor*) from South America, two West African Pythons (*Python sebæ*) from West Africa, a European Pond Tortoise (*Emys europæus*), European, two Glass Snakes (*Pseudopus pallasi*), a Lacertine Snake (*Cœlopeltis lacertina*), a Common Snake (*Tropidonotus natrix—var.*), South European, deposited; a Fraser's Squirrel (*Sciurus stramineus*) from Ecuador, a Ring-tailed Coati (*Nasua rufa*), a Cayenne Lapwing (*Vanellus cayennensis*) from South America, three Californian Quails (*Callipepla californica*), purchased; two Gayals (*Bibos frontalis*) from Assam, two Sumatran Porcupines (*Hystrix longicauda*) from Sumatra, an Indian Crocodile (*Crocodilus palustris*) from India, received in exchange.

OUR ASTRONOMICAL COLUMN

HARTWIG'S COMET.—Prof. Winnecke, in a circular issued from Strassburg on October 5, expresses the opinion that it is highly probable the comet discovered by Dr. Hartwig on September 29 was observed in the year 1506, and at his request Dr. Hartwig has submitted the point to calculation, using the first approximation to the orbit which we gave last week. Laugier computed elements of the comet of 1506, from the rough accounts left by European chroniclers and one in the Chinese annals, but his places were necessarily very arbitrarily fixed in this case, as may be seen on referring to his communication presented to the Academy of Sciences at Paris on January 26, 1846. It has not been consequently from any striking similarity between the orbits that Prof. Winnecke has been led to conjecture the identity of the comets, but rather, it would appear, from a general resemblance of track, allowance being made for the somewhat later appearance in the year of the comet of 1880. The Chinese observations do certainly in some cases enable us to make reliable approximations to the orbits of comets, as, for instance, in 568 and 1337; indeed for the latter comet they furnish a remarkably good outline of its apparent path, considering the difficulties which in many cases attend the interpretation of the Chinese accounts: nevertheless for the great majority of comets recorded in their annals the descriptions are unfortunately totally insufficient for this purpose, one very common failing being the omission of dates corresponding to the positions given, as for the comet of A.D. 178, which must have passed very near the earth from the long track it described in the heavens.

As regards European observations of the comet of 1506, Pingré tells us (on the authority of the Chronicles which, according to his excellent custom, are named in his margins), that a comet was seen in the month of August in the north, or between the north and east, or lastly between the west and north, and as the comet was not distant from the Pole, so that it appeared in the evening after sunset, and in the morning before sunrise, it may have had at different hours of the night the various positions mentioned by the historians. It had a long and bright tail which extended "between the fore and hind-wheels of the chariot." On August 8 a Polish historian, an eye-witness, says it was seen near the Pole above "the seven stars or the stars of the great chariot;" on the following night it was situated amongst the same stars, and later, on several nights, it was seen below them; declining by the signs Cancer, Leo, and Virgo, it attained the northern part of the horizon and disappeared on August 14. Some writers limit its appearance to eight days; others say it was visible for three weeks, or even a month.

With respect to Chinese observations, Pingré quotes from Gaubil's manuscript, of which he made so much use, which was preserved in the Depôt de la Marine at Paris in his time, but since understood to be lost, and from Mailla and Couplet. We have now the fuller translations by Biot and Williams. We read that in the first year of the epoch Ching Tih, in the reign of Woo Tsung, on the day Ke Chow of the 7th moon (1506, July 31), a star was seen to the west without the boundary of Tsze Wei (the circle of perpetual apparition). . . . After some days it had a short tail. It was seen between the sidereal divisions Tsan (determined by δ Orionis) and Tsing (by μ Geminorum), the Chinese sidereal divisions, it must be remembered, being intervals of right ascension with wide limits of declination reckoned from the determining star of the division, which we have here taken from Biot. It gradually lengthened, extending in a north-westerly direction towards or to Wan Chang (θ, υ, φ Ursæ Majoris). On August 10 it was bright, and moved to the south-east, it lengthened to about 5° and swept the upper of the stars Hea Tae (ν, ξ, Ursæ Majoris), and entered within the space Tae Wei Yuen (Biot's *Thai-Wei*), a space between stars in Leo and Virgo, to which, as also to Tsze Wei, the circle of perpetual apparition mentioned above, constant reference is made in the Chinese cometary observations. For the limits of this space Williams may be consulted. Biot and he substantially agree in their translations. Dr. Hartwig assumes the perihelion passage in 1506 to have occurred on July 1, old style, and with the elements of 1880 finds a track of which it is remarked, "Die Uebereinstimmung des so gefundenen Laufes mit dem wirklich beobachteten ist eine vollständige." The track is thus given:—

	R.A.	Decl.
	°	°
July 19	97·1	+39·3
29	106·6	61·3
Aug. 8	201·9	77·9
Aug. 18	250·1	+54·5
28	258·1	37·0

We should incline to characterise the presumed identity of the comets of 1506 and 1880 as one rather of possibility than of high probability.

From observations at Strassburg on September 29 and October 1, and one at Leipzic on October 3, Mr. Hind has deduced the following elements:—

Perihelion passage, September 6·9182 G.M.T.

	° ′ ″	
Longitude of perihelion	81 1 37	App. Eq. Oct. 1.
,, ascending node	44 19 47	
Inclination of orbit	38 28 11	
Logarithm of perihelion distance	9·558048	

Motion—retrograde.

As regards position the comet may be observed for many weeks, but the brightness will be rapidly declining. Since it was not detected till three weeks after perihelion passage, it is desirable that observations should be continued as long as practicable, if the character of the orbit is to be decided at this appearance.

GEOGRAPHICAL NOTES

THE newly-published volume of the Geographical Society's *Journal* contains some useful and even valuable contributions to geography. The veteran traveller, Capt. R. F. Burton, furnishes a memoir respecting the new map of Midian constructed by the officers of the Egyptian General Staff. Capt. Burton however, as might be expected, supplies geographical information beyond that given by the Egyptian officers. He also contributes a second paper of a different character on the subject of a visit to Lissa and Pelagosa. Even more valuable than Capt. Burton's first paper is Lieut. R. C. Temple's account of the country traversed by the second column of the Tal-Chotiali field-force in the spring of 1879, with his sketch-map of part of the country passed over by it between Candahar and India. This memoir has evidently been drawn up with elaborate care, and embodies a mass of important information. The notes upon some astronomical observations made in Kordofan and Darfur by Major H. G. Prout of the Egyptian Staff are also of value, and are accompanied by a map of routes in the two provinces, constructed by the Society's draughtsman from the reconnaissances of various officers in the service of the Khedive. Mr. E. Colborne Baber, lately our Consular representative at Chungking in Western China, also communicates through the Foreign Office some brief remarks under the heading of "Approximate Determination of Positions in South-Western China," to which are appended a number of tables of observations for latitude, &c.

IN the middle of last January Mr. W. S. Jerdan and a small party started from the Elderslie station on the Diamantina River, in Western Queensland, for the purpose of exploring the Mackinlay Ranges for gold. Leaving the Booker-Booker Mountain, with its dark fringe of gidya scrub, on their left, and Mount Munro on the right, they travelled up the Diamantina over splendidly grassed downs, and as they advanced up the river they found that the grasses became even finer and herbs more plentiful. After eight days' marching the party reached the neighbourhood of the Mackinlay River, and they report that the country passed over for some time previously was principally level plain, and just at that season perfectly bare, with the exception of a few tussocks. After about another week they got out of the low country and obtained their first good view of the Mackinlay Ranges, which they describe as presenting a very picturesque appearance in the distance, with their numerous pinnacles, peaks, and flat-topped mountains. The country along the ranges is covered with granite boulders, or else consists of decomposed granite flats infested with spinifex, with numerous sandy creeks running through it in all directions. The party spent about two months in searching for gold, but met with little success.

SIGNOR BIANCHI has reported to the Milan Society, which sent him out to Shoa and other parts of North-Eastern Africa for the purpose of making commercial explorations, that he has been able to make some corrections in the position of places as given in our existing maps. Antotto he places in 8° 53′ N. lat., 36° 15′ E. long., instead of its present position further north. Fanfinni is really north-north-east and not south of Antotto, while the Salala Mountains are fifty kilometres from Fanfinni, and not close to it. Lake Zouay he has not met with, though his route ought to have taken him to it, according to the map.

THE United States Navy Department have received through the Russian Government a letter from the Captain of the Arctic Exploration steamer *Jeannette*, dated from Cape Serdze Kamen, August 29, 1879, which reports the arrival of the *Jeannette* at that place on the afternoon of the above date. The letter states that the members of the expedition were all well, and that they expected to sail that night for Wrangell Land, by way of Kaliutchin Bay. This news has taken more than a year to reach America. The *Corwin* has arrived at San Francisco, and is reported to have searched all the region between Point Barrow and Herald Island, without finding any trace of the expedition. Still he thinks there is no reason yet to give up hope.

The new number of *L'Exploration* is an improvement on previous ones. We have a good article on the commercial relations between France and Russia; information as to the progress to their destination of MM. Revoil and Crevaux; an interesting analysis of an article on *Ausland*, on the country of Muata Yanvo, a letter from Dr. Quintin on a former expedition to the Upper Niger, and letters from Matteucci on the progress of his expedition in the Sudan. The notes are also much better edited.

CAPELLO and Ivens have furnished to the Portuguese Government a detailed account of their African explorations, a great number of drawings, and a comprehensive map containing an important part of Portuguese Africa, and also the adjacent territories. Next year Capello and Ivens will return to Africa to finish their explorations, and make a complete chart of the province of Angola.

THE death has just taken place at Pitminster, near Taunton, of Capt. Hobson, of the Royal Navy, who in his earlier days took an active part in the search for the remains of the late Sir John Franklin, and was the discoverer of the records which afforded the clue to the lamented explorer's fate. He was second in command, then holding the position of lieutenant to Capt. McClintock, who, in the year 1845, sailed in the *Fox* to search for the Franklin Expedition. Hobson was the leader of one of the parties which went in search of traces of Franklin, and he succeeded in finding the brief record which only too clearly set at rest the conjectures which the public entertained as to Sir John Franklin's fate.

THE expedition which left France on October 5 for the exploration of the country between the Upper Senegal and the Niger, though mainly for military and commercial purposes, is likely, if successful, to add greatly to the fulness and precision of our knowledge of that region of Africa. Astronomical, geodetical, and topographical officers accompany the expedition, so that we may expect important scientific results. The terminus on the Niger will be either Bamakou or Dina, above Yanina and Segou.

COL. FLATTERS has returned from his explorations in the Touareg region.

THE Wellington correspondent of the *Colonies and India* states that the area of the Crown forest lands in New Zealand in 1879 was estimated at 10,158,870 acres, but it has been proved that some of the most valuable kinds of timber have been recklessly used, and it is said that at the present rate of consumption all the splendid *kauri* forests will be exhausted in twenty-one years, and that the value of the timber will be about 11,000,000*l*. He does not however appear to have taken into consideration the very serious effect which this wholesale destruction of forests will have upon the climate of New Zealand.

PROF. ASAPH HALL ON THE PROGRESS OF ASTRONOMY[1]

ASTRONOMY, in some of its forms, reaches back to the most distant historical epochs, and the changes that it has undergone during this long lapse of time give to this science a peculiar interest. In no other branch of human knowledge have we such a long and continuous history of the search after truth, of the painful struggle through which men have passed in freeing themselves from theories approved by the wise of their own times, and in overthrowing beliefs which had become incorporated into the life and culture of those times. Perhaps the grand array of the heavens, and the vast phenomena which they display, naturally led men to the invention of complicated theories; but these passed away at last before the test of observation and the criticism of sceptical men; and the Copernican theory of our solar system, Kepler's laws of elliptical motion, and the Newtonian law of gravitation, gave to astronomy a real scientific character.

The discovery of the laws that govern the motions of the heavenly bodies, and the construction of the theory of these motions, demanded from practical astronomy better observations and a more accurate determination of the orbits of the planets and the moon, or of the constants that enter into the problems of celestial mechanics; and this demand led to an improvement in the instruments, and in the art of observing. The astronomers and instrument-makers of England and France led the way in these improvements. The great national observatories of those countries were established, and in England, Flamsteed and Sharp, Bird and Bradley, were foremost in raising practical astronomy to the condition of satisfying the demands of theory. But theoretical astronomy was soon to receive a wonderful advancement. Perhaps no one contributed more powerfully to this progress than Lagrange. The writings of this man are models of simplicity and elegance; and yet so complete and general are his investigations, that they contain the fundamental theorems of celestial mechanics. By the invention and perfection of the method of the variation of the arbitrary constants of a problem, and by the establishment of the differential equations of a planetary orbit depending on the partial differential coefficients of a single function, Lagrange reduced the question of perturbations to its simplest form, and gave the means of deducing easily the most interesting conclusions on the past and future condition of our solar system. To supplement this great theorist there was needed another kind of genius. Combining the highest mathematical skill with unequalled sagacity and common sense in its application, Laplace gathered up and presented in a complete and practical form the whole theory of celestial mechanics. Besides his numerous and brilliant discoveries in theoretical astronomy, Laplace gave us some of the finest chapters ever written on the theory of attraction,[2] and a complete treatise on the calculus of probability.

---

[1] Address as Vice-President of Section A, at the Boston meeting of the American Association.

[2] "Ein schönes Document der feinsten analytischen Kunst."—GAUSS.

By such labours as these the questions of astronomy were brought into order and classified, and the attention of astronomers was directed better than ever before to the determination of the quantities which must be found from observation. Moreover, the refinement of analysis and the completion of theory brought out new and more delicate questions, not less interesting, and requiring more complete investigation and more powerful instruments. The careful examination and study of the instruments and methods of observation became necessary, as well as complete and rigorous methods of reduction; and finally there was needed a critical and satisfactory method for the discussion of observations. For these last improvements in astronomy we are indebted chiefly to the astronomers and mechanics of Germany.

Among those who contributed by means of their optical and mechanical skill to furnish astronomy with the instruments necessary for its further advancement, no one holds a more honourable place than Joseph Frauenhofer. This man began his scientific work at the age of twenty-two, and died at thirty-nine, and yet in those seventeen years he gave to astronomy great improvements in the manufacture of optical glass, driving clocks for equatorials, and telescopes and micrometers, that in the hand of Bessel and Struve gave to observations a degree of accuracy hardly thought of before. To such men as Frauenhofer and his co-workers, who have carried on and improved the construction of instruments of precision, practical astronomy owes much; and yet, after all, the principal thing in a science is the man himself. No matter how excellent the instruments may be, the question whether they shall be used for the advancement of the science, and shall contribute the full value of their peculiarities to help towards increasing the accuracy of astronomical determinations, depends wholly on the astronomer. Again, astronomy is now so completely a science, and all its operations are so closely connected with theory, that no one is fit to have charge of an extended series of astronomical observations who has not a fair amount of theoretical knowledge. Without such knowledge his labour is apt to be thrown away, and is never so effective.

As a good example of what the modern astronomer should aim to be, we may take Bessel. To this man we owe a large part of our best methods for the examination and determination of the errors of our instruments and the introduction of complete and rigorous methods for the reduction of observations. Bessel's reduction and discussion of Bradley's observations was a masterpiece of its kind, bringing out the value of Bradley's work, which had lain unnoticed for more than half a century, and forming a starting-point for sidereal astronomy. This work was continued and perfected in his tables for the reduction of astronomical observations, published twelve years afterwards, a work that has done more than anything else to introduce order and system into practical astronomy. In the discussion of instruments and the determination of their errors, Bessel's conception of an instrument was that of a geometrical figure, and the positions of the lines and divisions of this instrument were considered with corresponding rigour. Although devoted almost entirely to astronomy, yet Bessel was an able mathematician, and of this he has left abundant proof. It seems to be necessary that a man should die and be forgotten personally before his work can be fairly estimated; but time adjusts these matters at last, and I know of no astronomer whose work promises to endure the judgment of the future better than that of F. W. Bessel.

It has been said that for producing the most puzzling compound of metaphysics and mathematics something which has neither height nor depth, nor length nor breadth, and which no one can understand, the German mathematician is unequalled. And at the same time it must be said that, for clearness of conception and beauty and precision of expression, Germany has produced in Gauss a mathematician who is unsurpassed, and who is worthy a place by the side of Lagrange. Omitting all reference to the works of Gauss in theoretical astronomy and in geodesy, which are many and important, I refer here only to his method for the discussion of observations and of deducing the most probable values of our constants. Almost the entire work of astronomy is a vast system of numerical approximation, in which the first steps are obvious and easy, but where the theory soon becomes complicated and the labour enormous. Thus the calculation of the approximate orbit of a planet or of a comet is the work of only a few hours; but the computation of the perturbations and the correction of the elements from all the observations may be the work of months and years. It is therefore of the highest importance that we should have a method for the discussion of observations that will give us the best result, and which will introduce order and system into this department of astronomy. Such a method is that of least squares. For the complete theory of this method and for nearly all the arrangements and algorithms necessary for its practical application, we are indebted to Gauss. The invention and application of this method to the discussion of observations of all kinds seems to me one of the greatest improvements of modern times, and its proper use will lead to a steady progress in astronomy. We must remember, however, that this method does not undertake the improvement of the observations themselves, as some have seemed to think; but, when rightly used, it produces simply the best result we can hope for from a given series of observations. It does not therefore dispense with skill and judgment on the part of the astronomer, but one is tempted to say that, if he has not these prime qualities, then the next best thing for him to have is the method of least squares. The use of this method has become one of the chief characteristics of modern astronomy, and if we compare the results of its application with those of the older methods, we shall see its superiority. Thus, for example, no astronomer of to-day who is accustomed to the modern methods of discussion, would be satisfied with the manner in which Bouvard represents in his tables the observations of Jupiter and Saturn, but would suspect at once some error in his theory of the motions of these planets.

The present condition of astronomy is the result of the continued labours of our predecessors for many generations; and to this result the lapse of time itself has largely contributed. For the full development of the secular changes of our solar system, for an accurate knowledge of the proper motions of the stars of our sidereal universe, and of the great changes of light and heat that are going on among them, the astronomer must wait until future ages. It is his present duty to prepare for that future by making the observations and investigations of his own day in the best manner possible; and to do this needs a careful consideration of the present condition of the science. Although the objects for observation have become so numerous, and the range of investigation so wide, that there is room for the most varied talent and skill, yet there is danger that there may be a waste of labour either in duplicating work, or in doing it in an improper manner. Especially may this happen in observations of the principal planets of our system, and of the fixed stars. In the case of the planets the observations are abundant, and the orbits are already well determined, except that of Neptune, for which, on account of its slow motion, we must of necessity wait for time to develop its small peculiarities, if such there be. For all these planets the observations at one or two observatories are amply sufficient, and even then the observations ought to be confined to a short time near the opposition, or at quadrature, and so made that they may be easily combined into a single normal position, which will suffice for the theoretical astronomer. To scatter such observations over a period of several months is to throw away one's labour, and to leave to the computer the disagreeable duty of rejecting a part of the observations as useless. It seems to me, therefore, unwise for several observatories to continue heaping up observations of the four outer planets of our system, when ten observations a year of each planet will give all the data that are needed. Again, for all the principal planets, observation is now in advance of theory, except, perhaps, in the case of one or two of them. Thus, for Saturn, all the tables are decidedly in error, and, although an attempt has been made to accuse the observations of this planet, it is quite certain that the trouble lies in the theory; for in the case of Jupiter and Saturn we have the most complicated planetary theory of our system, and one that has not yet been completely developed. It seems to me, also, that observations of our moon might well be confined to one or two observatories. Here again observation is far in advance of theory, if indeed there be now in use anywhere a pure lunar theory. All the lunar ephemerides that we have are affected with empirical terms, and the lunar theory itself remains an unsolved mystery. In this case there is no attempt to impeach the observations. The trouble seems to be with the perturbations of long period, and this does not call for numerous observations during each lunation. By a proper consideration of these matters astronomers may, I think, save themselves much useless labour.

Observations of the fixed stars are of the utmost importance in astronomy, since the positions of the stars are of the fundamental points on which depends our knowledge of the motions of the planets, the moon, and of the stars themselves; and it is on account of this fact that Bessel's tables, published in 1830, were of such great service, since they introduced correct and elegant methods of reduction, and clearly defined all the constants and epochs. We now have the positions of several hundred stars so well known that they may be safely used in the reduction of observations; and for these accurate positions we are largely indebted to the astronomers of the Pulkowa Observatory, who have made such absolute determinations a special work. There is still an opportunity for the improvement of these positions, and every well-executed determination will be of value; but it is doubtful if crude and irregular observations can add anything to our knowledge of the positions of these stars. Neither can the routine, mechanical style of observing, that is apt to prevail in large observatories, be of much use here. It would be better in most cases for such observatories to assume the positions of the fundamental stars, and to leave the further improvement of their places to skilful astronomers who understand the theory of such work, and who carefully study and become masters of their instruments. In these refined observations the refraction of light by our atmosphere also plays an important part, and this question will need to be examined at every observatory that undertakes to do independent work. It is true that every new and good meridian instrument may, and perhaps ought, to contribute something towards removing constant errors, and giving us a more accurate knowledge of a star's position; but when this position is very well known, the only way for further improvement is through complete and careful observations, and their thorough reduction and discussion.

In the observations of double stars but little had been done before the present century, and the labours of W. Struve form the real starting-point in this branch of astronomy. These labours have been ably continued by his son, the present director of the Pulkowa Observatory, and the observations of these two astronomers, extending over a period of nearly sixty years, are of the greatest value for our knowledge of the motions of the double stars. This is a branch of the science into which irregular workers are apt to enter, and where some of them have done good service; but if any amateur astronomer will compare his own work with that of the Struves, and will study the methods followed by them in determining their personal and instrumental errors, and will emulate the steadiness with which they have followed out their purpose, he can do much to enhance the value of his labour. Here the observations are simple, and easily reduced, and the chief requisites are skill and patience on the part of the observer. He should not be discouraged because he obtains no immediate or great reward for his work, or public notice, or because some one who rants about the nebular hypothesis and kindred subjects of which he knows nothing is for a time the great astronomer of the day. The observer will learn finally that a good observation of the smallest double star, or of the faintest comet or asteroid, is worth more than all such vague talk. The observation has a positive value, however small, but the physical theories of the universe, of which modern popular science is so productive, are generally worse than useless.

The first step towards a rational and trustworthy knowledge of our sidereal universe must come from a determination of the distances of the stars. The solution of this problem was attempted soon after the Copernican theory of our solar system was established, when it was seen that we have a long base line for our measures, or the diameter of the earth's orbit, and it was supposed that the solution would be easy. These early trials were all failures, but they led to some very interesting and important discoveries, such as Bradley's discovery of the aberration of light; to the knowledge of the fact that the determination of the parallaxes, or the distances of the stars, although simple in theory, is practically a difficult question; and then to an improvement in the instrumental means of observation, to a careful study of the methods of observation and the instruments, and to a recognition of the necessity of a complete and rigorous reduction of the observations. An examination of these early attempts is an instructive study. It is only about forty years ago that the solution of this problem was at last attained, and then only by the application of the most powerful instruments, and the best observing skill. An interesting result of the determinations of stellar parallax is obtained at once in the check it puts on speculations concerning the structure of the sidereal universe. The first astronomers who considered the parallaxes of the stars very naturally assumed that the bright stars are nearer to us than the faint ones, and therefore they observed the bright stars for parallax. Now, while this assumption may be true as a general statement, the actual determinations of parallax show that some of the faint stars which are not visible to the naked eye are much nearer to us than the brightest stars of our northern sky. Again it was assumed that a large proper motion is a certain index of a star's nearness to us; but observation shows that this also may be an erroneous assumption. This is a problem whose solution is only just begun, but already we know enough of its difficulties to see that we need the most powerful micrometrical apparatus that can be brought into use. The invention of some micrometer that, while as accurate as the present filar micrometer, would give the observer a much greater range of observation, and enable him to select suitable stars of comparison, is something much to be desired. At present the heliometer seems to be the best instrument for observations of this kind. Formerly it was thought that photography would furnish a good method for such delicate determinations; but so far the photographic methods have not given the necessary degree of accuracy in the measurements, and the astronomical use of photography is confined mostly to descriptive astronomy, where, especially in solar eclipses, it has rendered excellent service. Closely connected with the parallaxes of the stars and their proper motions is the interesting question of determining their motions to or from our sun according to the theory of Doppler. Here likewise the numerical determinations are so discordant, that we cannot have much confidence in the results. In both these cases we need more powerful apparatus, and a complete and thorough investigation of the methods of observation. Perhaps some of the large instruments now constructing may be employed in these methods, and we may soon have better results.

A great advance has been made in cataloguing the fainter stars. This work was begun by the French astronomers nearly a century ago, and was continued by Bessel, Argelander, and others. An important step towards the completion of this work was taken by Argelander and his assistants in their great catalogue of the approximate positions of 324,198 stars, which was finished in 1861. This census of the stars will soon be extended, we hope, over the whole heavens; and it already forms the groundwork for the great zone observations of stars now going on in Europe and in this country, and which must be nearly finished. These observations will doubtless reveal many interesting cases of the proper motion of the stars, and will certainly form the basis for a knowledge of the motion of our solar system in space, and for sidereal astronomy generally, such as we have never had before. Our American observatories can render a good service by observing stars of southern declination, since our observatories are ten or twelve degrees farther south than those of Europe, and thus have an advantage of position which ought to be made use of; and which may serve to unite into a harmonious system the observations made in the northern and southern hemispheres. The work of mapping the very faint stars near the ecliptic has also been greatly extended, and it is to this extension that we owe the rapid increase in the number of the small planets between Mars and Jupiter. But besides aiding in the discovery of the asteroids, accurate charts of the small stars have a permanent value in giving us a knowledge of the heavens at their epoch, and also some idea of the distribution of the stars in space.

It is an interesting question whether, among the thousands of nebulæ that are scattered over the heavens, any of them show changes of form or of brightness. These objects seem to be at least as distant as the stars, and as they have sometimes an area of several degrees, they must be bodies of an enormous extent. That changes are going on in these bodies seems probable, but to be visible at such distances the changes must be very great. In this case there is need of much caution in the discussion of the drawings made at different epochs, and by different astronomers with telescopes of different power; since the nebulæ change their appearance with the telescope used, with different conditions of the air, and with a variation of their altitude above the horizon. Here the excellent photometers that have been recently invented, and which are being so well applied to the determination of the brightness of the stars, may give us assistance. Perhaps also new drawings of the nebulæ, and their criticism and discussion, and a full recognition of the difficulties of making such drawings, will soon lead to a decision of the question of their change of form. Since the study of the light of the stars with new and improved photometers has now become a specialty, we may look for more exact and continued observations of the variable stars. This is a matter of which we know but little, and it is one where a persevering observer may do good service. Although he may not find any immediate encouragement in the discovery of remarkable relations among these stars, or the probable cause of their variability, he will be collecting observations that must form the test of every theory. As examples of the result of intelligent and persevering observation, we have the case of the sun-spots, which led directly to the discovery of their period, and its singular variability; and that of the shooting stars, which has shown us a very curious relation between these meteors and the comets, and one which may open to us the most extensive views of the relations between our own solar system and other systems in space.

The present condition of astronomy, with its vast and rapidly increasing store of accurate observations, offers many interesting subjects to the theoretical astronomer. The observations of the stars are now so numerous, and have been so fully reduced and criticised, and the time during which the observations have been made is so extended, that we shall soon have excellent data for a new and very exact determination of the constant of precession. The orbits of the planets and the moon, and their masses, are now so well known, that little uncertainty can arise from this source; and by taking into the calculation a great number of stars in different parts of the heavens, we may be able to determine the motion of the solar system in space, as well as the constant of precession. The constant of aberration also needs a new determination, and since this constant is so closely connected with the theory of light and its velocity, and the methods of its determination are still under discussion, it would be well if several astronomers could determine this constant independently. The value we now use was found by W. Struve from prime-vertical observations, and is apparently very accurate; but no astronomical constant should depend on the work of a single astronomer with a single instrument, when it can be determined so easily and by other methods. The old method of finding the value of this constant from the eclipses of Jupiter's satellites may yet give us a trustworthy value. The value of the other constant necessary for the reduction of observations, that of nutation, must be nearly that found by Peters in his well-known investigation of this question. This value may be verified by a new series of observations of Polaris, or of the declinations of stars situated so that this constant has its full influence on the reductions.

There are many subjects in astronomy that need investigation, but in most cases the labour required is very great, and the completion of the work would occupy a long time. This follows of course from the fact that, with the refinement of observations and their exact reduction, many small terms must be considered which formerly could be neglected. The lunar theory has been a vexed question for the last two centuries, and may remain so for a long time to come. This will no doubt be the case until some able astronomer, with the will and perseverance of Delaunay, shall undertake its complete revision. This question should now be looked on as a purely scientific one, and its definite solution should be undertaken. The theory should not be patched up by guesswork to fit the observations, but should be carried out with the utmost rigour. This is a problem to which a young and able mathematician may well devote his life, and we must expect its solution from some such clear-headed devotee of science. Several of the planetary theories need a new investigation, and some of them are already in the hands of able astronomers. That of mercury is especially interesting in connection with the intra-Mercurial planets, and it is to be hoped that Leverrier's theory of this planet may soon have a careful revision.

Again, among the secondary systems, the satellites of Jupiter and Saturn offer many interesting questions to the astronomer. At present the satellites of Jupiter demand a more complete theory and new tables of their motions. Corrected elements of these satellites may be required for reducing observations of their eclipses, and for deriving a new value of the constant of aberration. These satellites form a peculiar and interesting system, and their theory is so complicated that the labour of correcting their elements and forming new tables would be great, but still within the power of a persevering astronomer. The recent discovery of the connection of comets with streams of meteors has given additional interest to cometary astronomy, and there is plenty of hard work to be done in reducing observations, in computing perturbations, and in deducing the best orbits of the comets. The periodical comets have another interest, since they may give us information concerning the matter filling space. It seems to be probable from different reasons, such as the consideration of the light of the stars, that there must be matter spread throughout the celestial spaces; but the only heavenly body that has directly given us information on this subject is Encke's comet, which has a period of three years and a third. For a long time the motion of this comet was very completely computed by Encke, whose calculations show very strong proof of a resisting medium. These calculations were continued by Von Asten, whose early death prevented him from finishing his work, and the theory of this comet is left in an unsatisfactory condition. It is very desirable that the motion of this comet should be completely investigated, and although the method of the special perturbations of the elements followed by Encke is probably the best that can be used, still in such a case it would be well to apply various methods. Here again, on account of the frequent returns of the comet, the labour of computation is very great, and probably would be enough fully to occupy the time of one astronomer. The interesting questions connected with the motion of this comet ought to induce some one to undertake this laborious work, and these questions are so important that two or three astronomers might well be employed on its theory.

The methods of astronomy have now become so well established that the future advancement of the science is assured, especially since long intervals of time give an increased value to observations. Yet we may hope for improvement in instruments, for the introduction of new methods of observing, for better trained and more efficient astronomers; and perhaps also the rapid advancement of the physical sciences may furnish us with new and more powerful methods of investigation. There is an intimate relation between the instrument-maker and the astronomer, and they should understand each other better than is generally the case. It may seem a small matter that the divisions of a circle, or of a scale, should not be too finely or too coarsely cut; that the reading scale should not be placed in an inconvenient position, and that the illumination of the instrument should be carefully studied, and brought under the control of the astronomer; but these are really essential points, and, if not rightly arranged, are certain to weary the observer and to impair the quality of his work. Such mistakes will not be remedied until the makers better understand the uses of an astronomical instrument, and have correct ideas of the end to be attained. Since our American opticians have placed themselves at the head of their craft, we may hope that our instrument-makers will do likewise, and that they will soon be able to furnish us with the best instruments of precision.

There is one point to which astronomers should give more attention, and from which we may reasonably hope that great advantages to astronomy may come; and that is to the selection of sites for new observatories. It is possible, perhaps probable, that our instruments may be greatly enlarged and improved, and that important discoveries and improvements in the manufacture of optical glass may be made; but it seems certain that we have within easy reach very decided advantages for astronomical work by the choice of better positions for our instruments. Very few American observatories have been established for the purpose of doing scientific work, or with much thought or care for their future condition; but generally they are built in connection with some college or academy, and are the product of local and temporary enthusiasm, which builds an observatory, equips it with instruments, and then leaves it helpless. The atmosphere that surrounds us, and its sudden changes of temperature, are the great obstacles to the good performance of a telescope; and the larger the instrument, and the higher the magnifying power, the more serious are these hindrances. Now, with our present means of travel, we can easily place our instruments at an altitude of eight or ten thousand feet, and above a large part of the atmosphere. In this way we may be able to do with small instruments what at common altitudes can be done only with large ones; and when possible it is always better to use small instruments, since they are more easily handled, and are relatively stronger and better than large ones. Uniformity of temperature may be secured by seeking locations in the tropical islands, or on coasts like that of California, where the ocean winds keep the temperature nearly uniform throughout the year. At great altitudes we may secure a clearness of vision that would be of the greatest value in the examination of faint objects, and by this means, and by persevering and continuous observation, interesting discoveries may be made. It is a matter of course that, except in the case of comets, the future discoveries in astronomy will belong to faint and delicate objects; but these are interesting, and should not be neglected. A uniform temperature, which secures good definition, and steady images of the stars, is necessary for accurate determinations of position, and for all measurements of precision. This condition is especially important in such work as that of stellar parallax, the determination of the constant of aberration, and wherever the yearly change of temperature may act injuriously. In the selection of better sites for observatories I think we have an easy means of advancing astronomy.

As this science grows and expands, it will become more and more necessary to study the economy of its work, in order that astronomers may bestow their labours in the most advantageous methods, and may rid themselves of all cumbersome and time-consuming processes. The manner of publishing observations has already been much abbreviated, and improved I think, by some of the European astronomers, and this change seems destined to become universal. As the positions of many objects are now well known, the need of printing all the details of the observation, such as the transits of the wires, the readings of the micrometers, &c., is very slight; and this printing may be safely abandoned. Even this change will lead to a great saving in the time and cost of printing. But this will necessitate a more complete discussion of the work, and a more careful examination of the instruments; things to be desired, since they tend to lift the observer out of his routine, and make him a master of his business. There are objections to this change, and some of them are real, such as the importance of publishing a complete record; but this is overestimated, I think, since the original records ought always to be referred to in case of doubt; and other objections are factitious, such as the need of publishing a large and showy book in order to impose on the public.

We may hope also for improvements in theoretical astronomy, and for the better training and preparation of students of this science. I know that it is sometimes said that theoretical astronomy is finished, and that nothing more can be done. Such assertions come from professors who are old and weary, or from those young men who tire out early in life; but they are wrong. The improvements that Hansen has made in the theory of perturbations, and Poinsot's study of the theory of rotation, show what careful investigation may do, and assure us of further progress. It must be confessed that some of the astronomical work done in our country bears evidence that the astronomers did not understand the correct methods of reduction, and much of it shows evidence of hasty and ill-considered plans. This is perhaps a natural condition for beginners, but we trust that it has been outgrown. An actual need for the astronomical students of our country is a good book on theoretical astronomy, similar to Pontécoulant's work, in which the whole subject shall be presented in a complete form, such as we find in the "Mécanique Céleste," together with an account of the improvements made by Gauss, Poisson, Hansen, and others. There is no American book of this kind, and the English works are too partial, designed apparently to fit the student for college examinations, and not to give him a complete knowledge of the science. Such a book has hardly been attempted in our language, unless that of Woodhouse may be an exception, and it may be a long time in coming, since it requires a man qualified to do the work, and will involve an expense of labour in the preparation and of cost in publishing such as few are willing to incur. In the mean time it is far better for the student to go directly to the writings of Lagrange and Laplace, of Gauss and Poisson and other masters, rather than to spend time in reading second-rate authors who endeavour to explain them. And generally this will be found the easier way also, since the student avoids the confused notions and symbols, and the grotesque expressions and egotism of small men, and is lifted into the region of ideas and invention.

In presenting his exposition of the nebular hypothesis, which has since become so celebrated, Laplace says: "I present this hypothesis with the distrust which everything ought to inspire that is not a result of observation or of calculation." It is a singular fact that, among all the writings on the nebular hypothesis, I have never seen a reference to this presentation of it by its most distinguished advocate; and yet this is the true spirit of scientific astronomy. Laplace did not wish to exempt his own theories from criticism, and neither should any one. In astronomy there is no final human authority, no synod or council, but simply an appeal to reason and observation. If a theory or a discovery be true, it will stand the test of observation and of calculation; if false, it must pass away to that Miltonian limbo where so many things have gone and are going. The question is sometimes asked, Of what use is astronomy? and the reply generally made is that it has conferred great benefits on navigation and on commerce, since it is by means of his astronomical knowledge that the sailor determines the position of his ship on the ocean. There is a truth in this reply, but it is only partial. The great value of astronomy is that it is really a science and that it has broken the path and led the way through which all branches of science must pass if they ever become scientific. It is the spirit of honest, unrelenting criticism, and of impartial examination, that finally eliminates error and awards to every one his just due, that makes astronomy honourable and attractive; and it is by cultivating this spirit that astronomy confers its chief benefit, for it is thus that shall break in pieces and destroy all false assumptions in science and in philosophy.

SCIENCE IN NORWAY

WE have received several publications from Norway of scientific interest.

Nyt Magazin for Naturvidenskaberne. B. 25, H. 4. (Kristiania, 1880.)

In this number of the Norwegian "New Magazine for Natural Sciences" Herr Hansen continues his description of the annelids yielded by the Norwegian North Sea Expedition of 1878, to which he appends drawings of his own of all the rarer forms.—Herr L. Schmelck gives the results of his analysis of sea-water obtained in the same voyage within and near the Polar circle. The water was taken at various depths, and was obtained from a stratum intermediate between the surface and the bottom by means of an apparatus devised for the purpose by Herr Tornoe.—Herr Brogger and Reusch's observations on the character and localities of Norwegian apatite, which originally appeared in 1875 in the *Zeitschrift d. deutschen geologischen Gesellschaft*, are here translated into Norwegian by the authors, who have made various additions to their paper, which is illustrated with numerous drawings.—In a paper on the Lepidoptera of Norway by W. M. Schoyen the author draws attention to the number of new forms added to this branch of the Norwegian fauna since the publication, in 1876, of Siebke's list of the insects of Norway. The number given at that time for the lepidoptera was 934; it is now raised to 1,019. The writer's own contribution to these is 38 hitherto undetected Norwegian species, the habitats and characters of which he describes.

Kort Fremstilling af de Norske Kursteders Udvikling, &c. Ved Axel Lund, M.D. (Kristiania, 1880.)—In this *brochure* we are reminded that Norway, from her geognostic character, is naturally deficient in thermic springs, and we are shown that till recently the *water-cure*—taking the words in a comprehensive sense to include the use of waters internally and externally—was unknown in the country. In fact even now the Norwegians stand exceptionally low in the scale of water-using nations, although an encouraging change in this respect has been manifested of late years by the establishment of mineral and sea-bathing places in various parts of the kingdom. These Dr. Lund describes at great length, giving the analysis of the waters yielded by the few springs that have been opened, and the amount of salt present in the sea-water at the various marine stations, with the medical reports of each and the mode of treatment adopted. In the last respect the only difference that we observe from the system generally followed at German baths is that at the sea-bathing establishment in the Sandefjord, a small species of Medusa is used to excite local irritation in cases of cerebro-spinal, rheumatic, or neuralgic affections, by passing the animals rapidly over the parts affected. To Dr. Thaulow, the founder of the baths at the Sandefjord and at Modum, the Norwegians owe a large debt of gratitude as the first of their countrymen who drew public attention to the paramount importance of baths as a hygienic agent. Sweden has long been in advance of Norway in its appreciative comprehension of the curative value of mineral and sea-waters; and from Dr. Lund the reader will learn all that there is to learn in regard to the water-establishments, springs, and baths of the sister kingdom, while he may also gather some information respecting similar institutions in the Danish dominions. In conclusion, we may observe that some of the newly-opened Norwegian water-cure establishments, as that of Modum, lying in the midst of pine-woods, and the sea-bathing places on the Sandefjord and Kristianiafjord, offer numerous attractions to foreigners in respect to salubrity of air, beauty of position, and moderate cost of living.

Knudsho, eller Fjeldfloraen. J. B. Barth. (Kristiania, 1880.)—Herr Barth, who is well known for his animated descriptions of the natural scenery of his country, and his lively narrative of the adventures of a sportsman in Norway, supplies us in the present sketch with a comprehensive *résumé* of the flora of the Fjelds. The spot he has chosen for his point of observation is the double-topped hill Knudshö, near Kongsvold, well known to the botanists of other countries, as well as to those of Norway, for its exceptionally rich and varied Alpine flora. Here may be gathered the rare *Artemisia norvegica;* the gentians, *nivalis* and *glacialis;* some of the less common saxifrages, numerous species of *Carex* and *Salix;* and some Alpine forms, as *Kobresia caricina, Chamærops alpina,* which are not found elsewhere so low down; while here, too, the collector will find close at hand a number of sub-Alpine and south-Norwegian plants of rare occurrence in other parts of the country. Herr Barth, himself an enthusiastic botanist and a practised collector, never fails to give the local and ordinary Norwegian name of the plant he describes, in addition to its scientific designation; and thus supplies foreigners with very valuable and much-needed information, the want of which often proves to be a matter of great inconvenience in studying the flora of a foreign country.

Om Grantörken og Barkbillen. J. B. Barth.—In this little pamphlet the author, who is one of the first authorities in Norway on questions of forestry and arboriculture generally, explains his reasons for differing from the opinion commonly received, that the desiccation and ultimate death of the Norwegian spruce (*Abies excelsa*) are due to the attacks of *Tomicus typographus* (*Bostrychus typographus*), which is usually regarded as the most pernicious of all the insect-enemies of the Coniferæ. Herr Barth does not dispute the fact that this beetle is to be found often in large numbers on trees affected by abnormal drying up, whether still standing or cut down; but, in his opinion, although disease in the tree may be the cause, it is not the result of the presence of the Tomicus, which he believes to have absolutely no effect on the condition of the bark. According to this view the numerous agents employed in Germany and elsewhere to eradicate this beetle have no result but waste of labour and money; the only remedy against the drying up of the bark being a more scientific mode of clearing forests, in which the trees often perish either through overcrowding, or more frequently through reckless felling, by which cold blasts are allowed to fall directly on the interior. Herr Barth's views are in opposition to those of the majority of the working foresters of Germany and Scandinavia, but his extensive acquaintance with home and foreign forests, his great practical experience, and his reputation as a naturalist, entitle them to all possible respect, although it is not to be supposed that his plea for the innocuousness of the *Bostrychus typographus* will be admitted without much sifting of the evidence, seeing that this insect is generally believed by German foresters to have been the cause of the destruction of the forests of the Harz Mountains, when between 1780 and 1790 two million trees died of desiccation.

SPECTROSCOPIC INVESTIGATIONS[1]

AS I have stated in my former communication,[2] all chemically related elements exhibit a homology of spectra, the various spectra of the elements of a group differing solely in the manner in which their groups of lines are shifted towards one end or other of the spectrum.

In a comparative investigation on the alkaline earths, I have arrived at conclusions which may explain these remarkable analogies in chemically-related elements.

I have now the honour of laying before the Academy a brief account of my investigations; on another occasion I shall report on this subject more fully.

If the spectra of the alkaline earths are produced by a jar-spark in a hydrogen-atmosphere,[3] spectra are obtained which show the homology of the spectral lines very beautifully. The spectrum of magnesium cannot be compared with the spectra obtained in this manner, because it does not contain the less refrangible lines. However, without the jar, or employing a smaller battery and a smaller induction-coil, it appears that in the spectra of calcium and strontium all lines in the red and yellow disappear, and the spectra which become visible are remarkably similar to those of magnesium.

Comparing the less refrangible part of the spectrum of the alkaline earths, which are only rendered visible by increased temperature with the less refrangible half of the entire oxygen spectrum, we find the remarkable fact that these two halves of the spectra show a decided resemblance or homology. From this we may conclude that *the spectrum of the groups of the earth-alkali metals is composed of the spectrum of magnesium and of that of the less refrangible parts of oxygen.*

In order to determine the real importance of these remarkable analogies—it being known that the atomic weights of baryum, strontium, and calcium are capable of being composed of the atomic weights of magnesium and oxygen[1]—I found it necessary to analyse the spectra of combinations, which are not saturated, but behave as compound radicals, and thus most resemble in chemical behaviour the simple radicals or elements.

Hitherto I have analysed cyanogen and carbonic oxide. The cyanogen spectrum comprises two portions, one of which is the homologue of the nitrogen spectrum, the other the homologue of the less refrangible part of the carbon spectrum.

Also in the carbonic oxide spectrum there are present the well-known groups of carbon appearing as bands, and displaced in the red field there are several lines homologous to those of oxygen. Therefore the same relation exists between the spectra of nitrogen and carbon, and between the spectra of cyanogen, carbon, and oxygen, and carbon-oxide spectrum, which prevails between the spectra of magnesium and oxygen and the spectra of the earth-alkali metals.

One can go further and say that in general the homology of the spectral lines of chemically-related elements is in all probability based upon the circumstance that the elements of such natural groups conform to the laws of Mendelejeff on atom-weights, and consist of identical components.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

CAMBRIDGE.—The Science Lectures at Cambridge this term include Prof. Liveing on the General Principles of Chemistry, and on Spectroscopic Analysis; and Prof. Dewar on Physical Chemistry. One of the demonstrators will give demonstrations in Volumetric Analysis; and Mr. Scott, assistant to Prof. Dewar, will give a course of demonstrations in Elementary Organic Chemistry. For permission to carry out special investigations in the University laboratories application should be made to one of the Professors.

Lord Rayleigh will lecture on Galvanic Electricity and Electro-Magnetism in the Cavendish Laboratory; Dr. Schuster will lecture weekly on Radiation; Mr. Glazebrook will give an elementary course of demonstrations in Electricity and Magnetism; and Mr. Shaw will give demonstrations on the Principles of Measurement and the Physical Properties of Bodies. Courses of demonstrations are announced for the Lent Term on Heat and Advanced Electricity and Magnetism; and for the Easter Term on Light, Elasticity, and Sound.

Mr. W. J. Lewis will lecture on the Silicates, in the [Mineralogical Lecture-room.

Mr. F. M. Balfour will give elementary and advanced courses on the Morphology of Invertebrata, with practical work. Prof. Humphry will lecture on the Osseous System; Prof. Hughes on the Principles of Geology, with Field Lectures; Prof. Latham on Therapeutics; Prof. Newton on Invertebrata; Prof. Stuart on Mechanism.

It is to be hoped that something may be done this term to relieve science students in the matter of Greek, and to encourage French and German studies, for want of which there is so much hindrance to science, as well as literature. The Sedgwick Geological Museum, with money accumulating, must still wait, we suppose. Will the Museum be ready for 1900?

Mr. Sedley Taylor will lecture on the Acoustics of Music in the Cavendish Laboratory.

SCIENTIFIC SERIALS

Bulletins de la Société d'Anthropologie de Paris, tome iii. fasc. 2 (1880).—M. Robin, Inspecteur primaire du Département de Loir-et-Cher, has laid before the Society his scheme for obtaining important anthropological measurements by the help of teachers of schools. The proposed questions, with a full description of the various appliances by which such measurements could be taken, have been submitted to the consideration of a special commission.—M. J. Parrot's paper on the development of the brain in infants, considers the subject chiefly in reference to the modifications of colour which the medullary substance undergoes.—The present number of these *Bulletins* gives M. P. Broca's remarks on his "goniomètre flexible," of the various parts of which drawings are appended.—M. Harmand makes the interesting communication that some Cambodian inscriptions, hitherto undeciphered, have been found by Prof. Kern, of Leyden, to be Sanskrit, written in Kawi and Kalinga characters.—M. Vinson suggested that fixed rules should be drawn up for the transcription of foreign words, and should form part of the official anthropological instructions provided for travellers and explorers in savage countries. His suggestion has been accepted.—In addition to the article already referred to on the flexible goniometer, these *Bulletins* contain several papers from the pen of the late M. Paul Broca, which will be read with the more interest as being among the last of his communications to the Society; these are his post-mortem reports of the appearances presented in the thorax of a young Zulu girl, with his remarks on a retrogressive anomaly in the aorta of this girl; a description of the appearances of the cranium of the assassin Prévost, more especially with reference to the assumed importance of the protuberance between the occipital and parietal, to which Gratiolet applies the term *calotte*, and which he regards as a simian character. M. Broca considered that in the interests of physical science it would be desirable that greater facilities should be afforded to scientific men for obtaining the heads of those who die in public prisons, asylums, &c. Finally we have the report of M. Broca's remarks on the case of an illiterate boy of eleven, possessed of extraordinary powers of calculation, and evincing surprising facility in extracting cube-roots. The consideration of this case gave additional interest to the discussion that had been raised at an earlier meeting, in regard to Galton's observations on the vision of serial numbers.—M. Moudière has drawn up a monograph on the women of Cochin-china, in which he has embodied the results of six years' laborious anthropological researches. The three races of Annamites, Cambodians, and Chinese, of which the Cochin-china population is composed, were severally studied.—M. Bertillon gives the results of his comparative analysis of the statistical tables of suicides for France and Sweden. The results show singular accord between the two countries, and the author considers himself justified in maintaining that they establish the two following laws:—1. That widowers commit suicide more frequently than married men. 2. That the existence and presence in the house of children diminishes the inclination to suicide both in men and women.—M. René de Semallé gives a comparative table of the mean length of the generations of mankind, based on the genealogy of the reigning and other princely families in Europe. From these it would seem that the period of thirty years, which in common parlance is accepted as that of a generation, very closely corresponds with the means obtained from these genealogical data.—M. Fourdrignier gives the result of his exploration of the double tumuli found at Thuizy, near Rheims, among a large number of other graves in which only one individual had been interred. Where these graves have escaped earlier spoliation, the human remains and the broken fragments of ornaments found in them would appear to show that the individuals buried together were of different sex. M. Fourdrignier has made an interesting discovery of the several parts of two conical casques. The fragments of these singular head-coverings were extracted from two of the double graves, and, according to their discoverer, they belong to a Gallic race of the pre-Roman period, and must in form have closely resembled the modern German "Pickelhaube."

[2] "Ueber die Spectren der chemischen Elemente und ihrer Verbindungen" (vol. lxxvi. chapter ii, October, 1877). "Ueber den Einfluss der Dichte und der Temperatur auf die Spectren von Dämpfen und Gasen." (vol lxxviii chapter ii, October, 1878)

[3] With four of six medium Bunsen's elements and a great Gaiffe's induction coil giving a spark of 10 centimetres.

[1] It is, namely, $24 + 16 = 40$ (calcium), $24 + 4 \times 16 = 88$ (strontium), and $24 + 17 \times 16 = 136$ (baryum).

SOCIETIES AND ACADEMIES

PARIS

Academy of Sciences, October 4.—M. Wurtz in the chair. M. Perrier presented a *Compte rendu* of the determinations of longitudes, latitudes, and azimuths in Africa under his direction, at Géryville, Laghouat, Biskra, and Carthage in 1877 and 1878, with a description of instruments and methods. In the exchange of signals it was possible to calculate the mean retardation of transmission of a signal along an aerial conductor, from chronograph to chronograph, for distances comprised between 414 km. and 1,236 km. The mean velocity of propagation was found about 40,000 km. At this rate an electric signal would go round the earth in a second.—Military and geographical exploration of the region comprised between the Upper Senegal and the Niger, by M. Perrier. A Government expedition under Commandant Desbordes was to start on the 5th, Commandant Derrien having charge of the topographical department. They go to St. Louis, and make their way to Bafoulabé, at the confluence of the Bafing and the Bakhoy. Here they construct their first fort, and organise escorts and convoy, with a view to a general triangulation of the region between Bafoulabé on the Senegal, and Dina and Bamakou on the Niger. The railway contemplated would run from Medina, by Bafoulabé and Fangalla, to the Niger.—Order of appearance of the first vessels in the spike of *Lepturus subulatus*, by M. Trécul.—M. de Lesseps presented the "Bimensual bulletin of the Inter-oceanic Canal" for September.—On utilisation of the crystals of lead-chambers, by MM. Girard and Pabst. The crystals offer an abundant and economical source of nitrous acid, and the authors have been able to prepare on a large scale, the dinitric bodies, amidoazobenzol and nitroalizarine, by making the nitroso-sulphuric acid act on the corresponding amidised derivatives, or aniline and alizarine. But the crystals can only be employed in presence of a quantity of sulphuric or nitric acid (preferably the former) sufficient to prevent their decomposition by water.—Observations of Faye's comet made at the Observatory of Florence-Arcetri, by M. Tempel.—On some thermometric questions, by M. Crafts. It is very probable that the least change of volume of a thermometer is accompanied by a change of the coefficient of dilatation.—On the decomposition of salts by liquids, by M. Ditte. The laws of dissociation by heat which apply to decomposition of salts by pure water and by saline or acid solutions, apply also to decomposition by alcohols, and probably in general to decompositions of salts by the wet way, whatever the solvent.—On the physiological action of *Conium maculatum*, by M. Bochefontaine. Conine diminishes or abolishes the physiological properties of the nervous centres before acting like curare on the "nervo-muscular junctive substance" (Vulpian). In the dog and frog it at length abolishes the nervous excito-motricity if given in sufficient quantity, and it is fatal for batrachians as well as for mammalia. Hemlock then may act like curare, but it has additional physiological effects.—Floral dimorphism and staminal petalody observed in *Convolvulus arvensis*, L.; artificial production of this latter monstrosity, by M. Heckel. Petalody is the effect of direct fertilisation long continued. The autogamic process in plants as in animals (but in a longer period with the former) has the result of altering the organs of reproduction and leading to absolute infertility.

SCIENTIFIC WORTHIES

XVI.—RICHARD OWEN

AMONG time-honoured sayings there is none the truth of which comes more frequently home to the scientific worker than that which reminds him that a prophet is not without honour save in his own country and among his own kin. Its very truth would seem to make it short of impossible for us to take full cognisance of our own Scientific Worthies. The subject of this notice, still in hale strength, though now in full years and full of honours, is however in a very great measure an exception to the above proverb. Foreign men of science and foreign countries when they came to offer him their rewards found him already decorated. That a life abounding in labour, some of the results of which will remain as the heritage of mankind, was not undeserving of human recompense the following lines will abundantly show.

Richard Owen was born on July 20, 1804. He matriculated in the University of Edinburgh in 1824. Entering Bartholomew's Hospital the following year, he took the diploma of the Royal College of Surgeons in 1826. In 1825 he visited Paris, making the acquaintance of Baron Cuvier. On the completion of his medical studies Mr. Owen settled down to practise in Serle Street, Lincoln's Inn Fields. While at Bartholomew's Hospital he had been one of Dr. Abernethy's dissectors, and in 1828, on Dr. Abernethy's suggestion, he was employed at the College of Surgeons to make the catalogue of the Hunterian Collection in that institution. Mr. Clift was the Conservator of the College Museum at this time. The first catalogue of the invertebrate animals in spirits was published by the College in 1830, and in the following year appeared the memoir on the Pearly Nautilus (*Nautilus pompilius*), with some excellent drawings from the author's pencil.

The Zoological Society of London had been at this time in existence for some years, but up to 1830 it can scarcely be said to have had any scientific life. Some few of the then Fellows determined it should be otherwise, and after some little opposition the Council of the Society allowed the formation of a committee of science, who were further permitted to publish their own *Proceedings*. The first meeting of this committee was held on November 9, 1830, at which Owen read a paper on the anatomy of the Orang-Utan. It is not without interest to note that at the next meeting, held December 28, 1830, a letter was read from Vaughan Thompson, mentioning his discovery of a metamorphosis in Crustacea. From 1830 to the present date the contributions to the *Transactions* and the *Proceedings* of the Zoological Society of Mr. Owen have been both numerous and important, and for many years he was the unpaid prosector to the Society. He also at this period read several papers on pathological subjects before the Medical Society of St. Bartholomew's and the Medical and Chirurgical Society of London, one of the most remarkable of which was that describing the anatomical results of the ligature of the internal iliac artery, by Dr. Stevens, at Santa Cruz in 1812.

In 1834 a Chair of Comparative Anatomy was founded for Mr. Owen at St. Bartholomew's Hospital. In the year 1835 he published an account of a remarkable nematoid worm found living in the muscles of the human body (*Trichina spiralis*), and giving rise to a serious and often fatal disease called trichinosis, since, unfortunately, too well known. In 1834 he was elected a Fellow of the Royal Society, and in the same year was appointed the first Hunterian Professor at the Royal College of Surgeons. This chair he continued to fill until 1855. Mr. Owen, on succeeding his father-in-law, Mr. Clift, as Conservator of the Museum of the College of Surgeons, gradually retired from professional practice, and after a short time devoted himself exclusively to scientific pursuits. Of the thirty years during which he worked at Lincoln's Inn Fields, the last twenty were mainly spent in the study of comparative anatomy. A very rapid survey of the immense amount of work accomplished by him during this period will not be without interest. The catalogue of the physiological specimens in the Hunterian Collection consists of five quarto volumes, which were published by the Council of the College of Surgeons between 1833 and 1840. The catalogue of osteological specimens is contained in two quarto volumes published in 1853, and that of the Fossil Vertebrates and Cephalopods in three quarto volumes published in 1855.

The great work on the study of teeth was issued between 1840–1845. In preparing the drawings for this work Prof. Owen was threatened with an attack of retinitis, and was compelled to commit the further preparation of the illustrations to the excellent artists Lens Aldous and Erxleben.

The well-known Lectures on Comparative Anatomy and Physiology appeared between 1843 and 1846. After a one-and-twenty years' study of the homologies of the vertebrate skeleton, Prof. Owen's era-marking work on the "Archetype and Homologies of the Vertebrate Skeleton" was published. After having made a certain progress in comparative anatomy the evidences of a greater conformity to type, especially in the bones of the head of the vertebrate animals, than the immortal Cuvier had been willing to admit, began to enforce on Prof. Owen a re-consideration of Cuvier's conclusions to which for long he had yielded implicit assent. The results of these reconsiderations were successively communicated to the Royal College of Surgeons of England in the Course of Hunterian Lectures for 1844–45, and a sketch of his general views on the subject was laid before the British Association at Southampton in 1846. In 1849 were published the memoirs "On the Nature of Limbs," and "On Parthenogenesis." The term "parthenogenesis" was devised to replace a phrase somewhat cumbrous and incorrect, which was to this time applied to designate a phenomenon as interesting as strange.

Nor was all this sufficient for the superabundant energy of the Hunterian professor. The Palæontological Society succeeded in enlisting his services for a series of monographs of British fossil vertebrates, and during this period were published a memoir on the "Fossil Chelonian Reptiles of the Purbeck Limestones and Wealden Clays" (1853), the various supplements to which date from 1859 to 1879; "On the Fossil Reptiles of the London Clay" (1849, 1850), the portion of this memoir relating to the Chelonia was in part written by the late Prof. Bell; "On the Fossil Reptiles of the Cretaceous Formations" (1851). A remarkable series of papers on the Fossil Birds of New Zealand and on some Fossil Mammals of Australia also about this date appeared in the *Transactions* of the Zoological Society, and a very elaborate memoir on the great American Megatherium in the *Philosophical Transactions.*

But even amid a scientific activity that rivalled that of his great friend Baron Cuvier, Prof. Owen had the energy to devote some time during these thirty years to the more direct benefit of his fellow men. He was appointed one of the Commissioners to inquire into the Health of Towns. This Commission sat during 1843 and 1846. A special report from his pen on the sanitary state of his native town, Lancaster, appeared in 1848, and the improved sewage of that town with a new water supply on the unintermittent system followed. He was appointed as one of the Commissioners on the Health of the Metropolis, 1846, 1848, and again on the Commission on the Meat Supply in 1849; as the result of this latter Commission it will be remembered that the famous market at Smithfield was suppressed, and the large Cattle Market was transferred to Islington.

Prof. Owen was also one of the Commissioners for the Great Exhibition of 1851; Chairman of the Jury on Raw Animal Products applied to Food and Manufactures, and Vice-Chairman of the Jury for "Les Substances Alimentaires" in the Great Exhibition of Paris in 1855. Labours so abundant were not without reward. In 1842 the Royal Society conferred on him the Royal Medal for his memoirs on the General Economy of the Monotremes and Marsupials. In 1846 the same society decreed to him the Copley Medal. In 1851 the King of Prussia sent to him the "Ordre pour le Mérite." In 1852 her Most Gracious Majesty assigned to him a residence in Richmond Park, and in 1855 the Emperor of the French bestowed on him the cross of the "Légion d'Honneur." The old Universities of Oxford, Cambridge, and Dublin conferred on him honorary degrees. The Royal College of Surgeons of Ireland made him an Honorary Fellow, and most of the learned societies of Europe and America numbered his name on their lists of Honorary or Corresponding Members.

John Hunter had left behind him a very abiding monument of his labours, some idea of which could now be obtained from the patient labours of the first Hunterian professor; but on terminating those labours Prof. Owen bethought him of yet another way in which he could make known the thoughts and works of the founder of philosophical surgery, which was, by the publication of Hunter's original papers. Between 1793 and 1800 Mr. Clift, F.R.S., had sole charge of the Hunterian collection and manuscripts, and during this period he had copied some proportion of the latter before they were removed from the Museum in Castle Street, Leicester Square, by the executor, Sir Everard Home. A short time previous to Mr. Clift's death he placed in Prof. Owen's hands the whole of his transcripts of the Hunterian manuscripts, with an autograph statement of the important fact. These were published in two volumes in 1861, and thus, after an entombment of nearly seventy years, were added "to the common intellectual property of mankind."

Prof. Owen's connection with the Royal College of Surgeons ceased in 1856, when he was appointed Superintendent of the Department of Natural History in the British Museum. He was the Lecturer on Palæontology at the School of Mines in Jermyn Street in 1856, and Fullerian Professor of Physiology in the Royal Institution of Great Britain in 1858.

When Prof. Owen entered on his duties at the British Museum his attention was at once called to the subject of the want of space, wherein to stow the rapidly-increasing natural history collections. For several years already had Dr. Gray, to whom this Museum owes so much, urgently demanded additional space. In 1851, in 1854, and again in 1856, Dr. Gray implored for more room; scarcely half of the zoological collections was exhibited to the public, and their due display, he declared, would require more than twice the space devoted to them. Numerous suggestions were made to remedy this state of things, but without avail. Even such distinguished trustees as the late Sir Roderick Murchison and Sir Philip Grey Egerton, backed though they were by a large and most influential body of scientific memorialists, were powerless to obtain the least of the additions to the British Museum which they had recommended—additions which long ere this date would have been overcrowded in their turn. The Government declined to carry into effect any alterations in the present building in Great Russell Street, preferring the alternative of a severance of the Natural History Department from the British Museum. At this juncture it seemed to Prof. Owen to be unwise and indeed even wrong to hazard the safety and utility of these collections by persisting in the advocacy of a course which was futile, and having satisfied the then Chancellor of the Exchequer of the exigencies of the case, plans were obtained for a large new museum at South Kensington which would afford a superficial space for display of the collections, systematically arranged, of about five acres. Prof. Owen's report (1859) was approved of, but a vote on account of the new building was negatived by the House of Commons. This led to the publication of a pamphlet by Prof. Owen, "On the Extent and Aims of a National Museum of Natural History," in 1862, and as a final result the Government obtained the sanction of Parliament in 1872 to the erection at South Kensington of the magnificent range of buildings there just completed, in which in process of time the whole of the natural history treasures of the British Museum will be systematically arranged.

For long the propriety of moving this collection from Great Russell Street was hotly contested, and as in other great questions the weight of authority could at one time be quoted as against the move. Scientific men are however as a rule not often to be unduly swayed even by authority and they are generally philosophical enough to accept accomplished facts. In this immense building the State has provided ample accommodation, so far as space is concerned, for the present collections and for the probable increase of these for another generation; and not content with this, there is in addition room enough for future generations if they feel inclined, to nearly double the available space, and thereby even add to the beauty and completeness of the whole structure. In the obtaining of this splendid casket in which to display Nature's gems, Prof. Owen has seen accomplished one great object of his life; and even those who think it might have been better for science had their own peculiar plans been carried into effect, will hardly grudge Prof. Owen the palm of victory which he may have won from them.

The necessary and often arduous routine work required of Prof. Owen as head of so large a department did not in any great measure diminish the extraordinary activity with which he from time to time published original works. Nearly a quarter of a century has elapsed since he entered on his duty at the British Museum, and the record of his contributions to science during this period equals, if it does not surpass, that of the previous thirty years period. Among the more important of these we must notice: Memoir on the British Fossil Reptiles of the Mesozoic Formations—Pterodactyles, 1873-1877; on the British Fossil Reptiles of the Liassic Formations—Icthyosaurs and Plesiosaurs, 1865-1870; on the British Fossil Cetacea of the Red Crag, 1870; on the Fossil Reptiles of South Africa, 1876; on the Classification and Geographical Distribution of Mammals, 1859; a Manual of Palæontology, 1861. The long list of papers published in the *Proceedings* of learned societies, to be found in the Royal Society's invaluable Catalogue (numbering over 360), includes many, the scientific value of most of which would have given an abiding fame to their author. It would be impossible here to give even a tithe of their titles, but we quote a few to show that Prof. Owen left few of the classes of the animal kingdom unnoticed:—On the Andaman Islanders; on the Anthropoid Apes; on the Aye-Aye; on the Giraffe; on the Great Anteater; on the Great Auk; on the Dodo; on the *Apteryx australis*; on *Lepidosiren annectens*; on the *Argonauta argo*; on *Spirula australis*; on Clavagella; on *Limulus polyphemus*; on Entozoa; on *Euplectella cucumer* and *E. aspergillum*.

In 1857 he was elected president of the British Association for the Advancement of Science. In 1859 he was chosen one of the eight Foreign Associates of the Institute of France (in succession to Robert Brown). The King of Italy conferred on him the "Ordre de St. Maurice and St. Lazare" in 1862. The Emperor of Brazil in 1873 gave him the Imperial Order of the Rose, while in the same year the Queen conferred on him the Order of the Bath. In 1874 the Academy of Medicine, Paris, elected him as one of their Foreign Associates in succession to Baron Liebig.

At an age when most men have to cease from their labours, the subject of this necessarily brief notice works on. No better proof could there be of a spirit still young, than to witness the energy with which he has entered on the occupation of the new home for natural history at South Kensington; and who will not join in the hope that he may live to see its treasures arranged in an orderly sequence. In this sketch we have presented Prof. Owen as one eminently qualified to take high rank among our Scientific Worthies. What niche in the temple of fame he may permanently occupy is perhaps better left to a generation removed from our own to determine. To us it would seem as if a double portion of the spirit of Cuvier had without doubt fallen upon Owen, who has raised for himself a monument of work that is truly stupendous.

INSECT VARIETY

Insect Variety: its Propagation and Distribution. Treating of the Odours, Dances, Colours, and Music in all Grasshoppers, Cicadæ, and Moths; Beetles, Leaf-Insects, Bees, and Butterflies; Bugs, Flies, and Ephemeræ; and Exhibiting the Bearing of the Science of Entomology on Geology. By A. H. Swinton, Member of the Entomological Society of London. (London, Paris, and New York: Cassell, Petter, Galpin and Co. No date.)

WHEN Mr. Darwin published his "Descent of Man" in 1871 non-entomological readers were first made acquainted with a host of interesting facts connected with the various sounds produced by insects, the different colours in the two sexes, with their corresponding senses, emotions, and habits, so far as these bore upon the question of sexual selection. As in so many other cases Mr. Darwin's volume was the means of attracting the attention of working entomologists to this interesting field of observation, which has since been assiduously worked by Dr. Fritz Muller in Brazil, while in this country Mr. Swinton has for many years devoted himself to its study, both by personal observation and by collecting together the scattered observations spread over the entire literature of entomology, the result of his labours being embodied in the present volume.

No more interesting or instructive subject could be found for a great entomological work. The author appears to have spared no pains in the collection and elaboration of his materials. The book is full of original observations, and carefully drawn tabular statements of facts. It is copiously illustrated with roughly executed but characteristic figures; and the writer is evidently a man of wide information and some literary skill. But notwithstanding all these points in its favour, the book—except as a mere collection of facts—is a disappointing one. The arrangement is frequently defective; the style is often so vague and high-flown as to be actually unintelligible; while whenever an attempt is made to generalise the facts adduced, the writer appears to have no definite views of his own, or if he has is quite unable to convey them to the reader. A few examples will serve to illustrate the several merits and defects here pointed out.

In discussing the combats of male insects as tending towards a selection of powerful males from which to continue the race, our author well remarks that the law of the prior appearance of the males subjects them also to all atmospheric and other influences, "rendering them inured to manifold terrestrial strife previous to propagating their kind." This is a good observation; but what is probably a more important function of the early appearance of the males is, that the females should not have to wait long in order to be impregnated and thus be exposed to the dangers of destruction, owing to their usually slower flight and consequent defencelessness, before their great duty of oviposition has been safely performed.

The remarkable discovery by Dr. Fritz Muller of scent-producing organs in a variety of Brazilian butterflies, is here supplemented by an account of the numerous cases in which analogous organs, often of very varied kinds, have been found in moths, though in comparatively few instances has any odour been actually detected. It may however very possibly exist even though quite imperceptible to us. Most of these organs occur in male insects only, whereas it is undoubtedly the case that the males discover the females at great distances, and we should therefore anticipate that the latter would have the scent-producing organs, the former the sense-organ capable of perceiving the odour. The investigation of this obscure subject is however still in its infancy.

Whether the antennæ are organs of touch only or of some other sense is yet undecided, but the question might probably be solved by an experimenter as ingenious and persevering as Sir John Lubbock. Mr. Swinton speaks of the male butterfly or moth "running over his partner with snuffing antennæ," but this is begging the question; and the following observation, though interesting, does not throw much additional light on the subject: "One dull afternoon on the 4th of September during the wet season of 1879 my eye was arrested by the pretty dappled wings of a female of the large Magpie Moth who was flying most purposely from leaf to leaf along a hedgerow. She successively visited a reddening bramble, a hawthorn, clematis, and guelder-rose, fruitlessly touching over their glandular surfaces with a quick alternate vibration of her black antennæ, in search, as I at first supposed, of honey-dew. The crisping foliage of a thorny sloe finally arrested her, and seemed to confer satisfaction on her tactile perception; for raising simultaneously her feelers and crawling on to the centre of a leaf, she hung on at its upper surface, elevated her wings, and by curling her abdomen round its apex, began to methodically attach her oval and shagreened eggs to the underside close to the midrib. She could distinguish Souchong from Pekoe."

The account of light-giving insects is very unsatisfactory, the old theory of the light serving as a guide and attraction to the male being the only one given. Yet in the list of luminous insects appended to the chapter we find no less than six cases recorded in which larvæ or pupæ are luminous, a fact which might surely have suggested a doubt as to the use of luminosity as a sexual attraction in the case of the glowworm and fireflies. There being so many luminous larvæ, taken in connection with the fact (not mentioned by Mr. Swinton) that glowworms are distasteful to birds, renders it almost certain that Mr. Belt's explanation is the true one, and that luminosity is, primarily, a warning of uneatableness, and is therefore a protective character, though it may of course, like colours, serve the purpose of aiding discovery and recognition by the opposite sex.

The whole subject of colour is treated with vagueness and indecision, and we find no systematic grouping of the facts nor any firm grasp of a principle by which to interpret them. The following characteristic passage will illustrate these deficiencies:—"The attractive quality of insects' colours from the foregoing appears nearly that presented to the human eye, and, utilised in sedentary or aerial display, originates phenomena of love and rivalry, battles, dances, and gregariousness in evident parallelism with those evoked by music. But this attractive virtue, which must be considered as stimulative, does not reside especially in either sex, as some at first sight might be inclined to assert; for we find conspicuous colorisation, though for the most part distinguishing the males, sometimes by a species of inversion appearing in the females; the sexes also are often very similar in hue. And the reason of this is that the females very generally attract the eager males by sedentary display, of which the moth kind affords notable instance. Here we may remark the paler hues of many heavy Bombycina females who exhibit on herbage, and the grey, white, or satiny shades of moths that repose on tree-trunks, sexually marked in the Gipsy Moth, who is rendered in measure terrestrial by her limp wings. Others more or less apterous, like the Vapourers and Psychidæ, owe what little chromatic attraction they possess to their conspicuous cocoons."

There is hardly a sentence in this paragraph that is not open to discussion or that is not more or less inconsistent with some other sentence; while the whole is completely neutralised by the succeeding paragraph which goes on to describe how the male moths are evidently attracted to their partners by odour, and not by sight at all!

The chapter on the sounds produced by insects is crowded with interesting observations and is certainly of great value, yet here too we meet with the same looseness of remark and incapacity to see the importance of certain facts. Thus, we find the strange, and in the present state of our knowledge altogether unproved statement, that—"In Lepidoptera music is in direct relation to colour, sound to beauty;" while the fact that the *pupal* form of some Hemiptera stridulate, taken in connection with many proofs that the sound is produced under the influence of *fear*, shows that in some cases at all events these sounds are protective rather than sexual; and this opens up a field of inquiry analogous to that of the diverse uses of colour, but which our author passes over almost without remark.

Among the smaller errors and misconceptions in the volume we must note the statement that Darwin adopts the pressure theory of the formation of the bee's cell (p. 58); the total misconception of the theory of mimicry (at p. 81); and the extraordinary account of tropical colour, certainly evolved out of the writer's own consciousness. He says:—"In the Brazils, for example, all colours, whether of birds, insects, or flowers, are brilliant in the extreme. Blue, violet, orange, scarlet, and yellow are found in the richest profusion, and no pale faint tints are to be seen"! In the matters of Palæontology and glacial epochs the author's authority is Mr. Page; but the subject is evidently beyond him, for he confounds the precession of the equinoxes with the obliquity of the ecliptic, and winds up with "glacial phenomena at the poles now exposed to the continuous action of cold interstellar space, with a collapsing in the earth's superficies, giving birth to the ensuing wrinkling marked by earthquakes, volcanic action, and land depression, or *vice versâ*."

We also notice many errata, indicating some carelessness in passing the volume through the press. Dr. Falconer is called "Faulkener" (p. 15); anthropods is written for arthropods (p. 86); Leucanidæ for Lucanidæ (p. 99); Grophilus for Geophilus (p. 101); and Libuella for Libellula (p. 311); but the chief fault of the volume is a constant effort at fine writing, which, combined with an inveterate obscurity of style, often renders it utterly impossible to comprehend what is meant. Scores of passages might be quoted illustrative of this peculiarity, but the following will serve our purpose:—

"Dealing with geological chronology, the phenomena of generic and specific variation should also be applicable in explanation of certain plants and insects of constant character, being discovered confined to various geological soils within the radius of their distribution, or to favourite haunts postulating more than simple dispersion from a centre. And the pale blue of butterflies frequenting limestone and chalky downs need evoke no interference in the law of albinism if the honeyed cowslips and downy oxlips over whose leaves they flutter are, as reputed by Linnæus and Prof. Henslow, specifically identical with the shadow-seeking primrose, and may be raised from the same root. So likewise the local feature of melanism may be regarded as not only manufacturing annual varieties, but as pervading the black, brown, and drab tribes of the Alpine, Arctic, and woodland faunas, and may give a reason for their dark trait of beauty."

We give up the above in despair of extracting its meaning, if it has any; and cannot but regret that a book so full of valuable facts and good observations should be spoilt by constant efforts at philosophical disquisition, for which the tone of mind of the writer quits unfits him.

WEAPONS AND POLITICS OF THE ANCIENT HINDUS

On the Weapons, Army Organisation and Political Maxims of the Ancient Hindus, with Special Reference to Gunpowder and Firearms. By Gustav Oppert. (Madras: Higginbotham and Co.; London: Trubner and Co., 1880)

"WHILE pursuing my researches into ancient Indian history," says Dr. Oppert, "I lighted upon two ancient Sanskrit manuscripts containing interesting information on many new and important topics. One of them, the Nītiprakā'sikā, has been, I believe, up to now utterly unknown, and the other, the 'Sukranīti, though known to exist, has never been described and published." The manuscripts relate to the weapons and military organisation of ancient India, a subject upon which fresh light was much needed. If for no other reason, therefore, they deserved to be edited and translated. But one of them at least also contains statements sufficiently novel and startling to claim for them a special hearing. If we may believe it, not only was gunpowder invented in India long before the days of Berthold Schwarz or Roger Bacon, but firearms, including both cannon and guns, were known and used. The guns were even provided with sights and flints. "The tube" of one of them, it is said in the 'Sukranīti, "is five spans long, its breech has a perpendicular and horizontal hole, at the breech and muzzle is always fixed a sesame-bead for aligning the sights. The breech has at the vent a mechanism which, carrying stone and powder, makes fire by striking. Its breech is well-wooded at the side, in the middle is a hole, an *angula* broad; after the gunpowder is placed inside, it is firmly pressed down with a ramrod. This is the small gun which ought to be carried by foot-soldiers. . . A big gun is called (that gun) which obtains the direction of the aim by moving the breech with a wedge; its end is without wood; but it is to be drawn on cars. . . . The ball is made of iron, and has either small balls in its inside or is empty." Dr. Oppert believes that the Nītiprakā'sikā also contains references to firearms, though the passages he quotes seem rather to refer to supernatural weapons or to fire-machines like those used by the Greeks of the Eastern Empire. A work, too, which mentions the Hūnās ("Huns," or Europeans) cannot be of the antiquity to which he would assign it.

Dr. Oppert seeks further support for the early use of firearms in India in a passage from a portion of the Atharvaṇarahasya, which he renders: "the fire prepared by the combination of charcoal, sulphur, and other material depends upon the skill of its maker." It is plain, however, that there is no necessary allusion to gunpowder in these words, much less to firearms. A quotation from Manu, in which fighting with "darts kindled by fire" is forbidden, is equally inconclusive.

The statements of the 'Sukranīti must therefore stand by themselves. In spite of Dr. Oppert's arguments to the contrary, it is difficult to admit that in its present form it can be earlier than the thirteenth century. The prohibition to use firearms in "fair" fighting would not account for the total absence of any reference to them in the law-books and epics and other literature of ancient India, and had they existed in the seventh century, or had the Hindus been acquainted with gunpowder at that time, we can hardly suppose that the fact would have remained unknown to the inquisitive Buddhist pilgrims from China who have left us accounts of their travels in the Peninsula. The Greek fire had nothing to do with gunpowder, and we do not therefore see why Dr. Oppert introduces it into the discussion, while there is no proof that the *manjanik* or machine employed by Mohammed Kasim at the siege of Daibal (A.D. 711) was propelled by gunpowder. The flaming thunderbolts launched by the Indians against the army of Alexander, according to the pseudo-Aristotle, belong to the region of myth, like the storms of lightning with which Herakles and Dionysos were received when they invaded India, as related in the romance of Philostratos. Gunpowder may indeed have been invented in India, as Beckmann believed, but if so we want further evidence before we can admit that the invention was earlier than the twelfth or thirteenth century of our era.

Among other interesting points noticed by Dr. Oppert are the (ideal) rate of pay received by the officers and privates of a Hindu army at the time the Nītiprakā'sikā was composed, and the identification of Manipura, the capital of the Pāndya kings, with the modern Madura. He also points out that the boomerang is well known in many parts of India, especially in the south, and that he himself possesses four wooden ones, besides an iron one, which he obtained from Pudukoṭa. Two ivory ones, from the armoury of the late Rajah of Tanjore, are preserved in the Madras Museum. The Tamil name of the boomerang is *valai taḍai*, or "bent stick," and it is employed in hunting deer. It is one of the weapons described in the Nītiprakā'sikā under the name of *āstara* or "scatterer."

OUR BOOK SHELF

Lehrbuch der organischen Qualitativen Analyse. Von Dr. Chr. Th. Barfoed. (Kopenhagen: Andr. Frest und Sohn, 1880.)

THERE is no branch of qualitative chemical analysis in such an unsatisfactory condition as that which deals with organic acids and bases. The plans on which examinations in practical chemistry are generally conducted are probably largely to blame for this unsatisfactoriness. Examiners require a knowledge of the separation and identification of organic acids, in addition to the ordinary power of analysing a mixture of inorganic substances; one day is probably considered sufficient time to devote to the examination. Candidates must make themselves acquainted with a few of the tests for organic acids; they find these in all the text-books of analysis; they repeat the tests, and manage to stumble through the examination. The truth is that the detection of organic compounds, even when but a few of these are present, is far too complex and difficult a process for repetition in the hurry and bustle of the examination-room. Were all organic compounds omitted from the examinations in practical chemistry at the leading schools of medicine and science, we have no doubt that in a few years the processes for detecting these compounds would be largely improved.

We should strongly advise all students who wish to acquire just that amount of knowledge of organic analysis which may perhaps enable them to pass an examination *not* to procure Dr. Barfoed's book, and as strongly advise all who wish to study this branch of analysis in a thorough and accurate manner to procure the book, or rather that part of it which is now published, at once. The publishers of this work announce that the book will be completed in three parts; if the second and third are as fully and accurately compiled as the first, the book will undoubtedly be the standard work of reference in the department of organic qualitative analysis.

The first part, extending to 192 pp., contains the more important acids, cellulose and starch. A full account is given of the properties and reactions of each compound so far as these are of value in qualitative analysis; methods of separation, varying according to the conditions of complexity of mixtures, are also given. The book is not arranged after the ordinary plan of the text-books of inorganic analysis; it is rather a full and accurate store of information regarding the reactions of organic compounds from which the student may select materials according to the special conditions of the problem presented to him.

The work contains no preface or indication of the ground to be covered by the completed book; judging however from the scope of the first part, the author would seem to aim at presenting a complete account of the reactions of all those commonly occurring organic compounds which can, with a fair degree of certainty, be identified by qualitative analysis.

A Synopsis of Elementary Results in Pure and Applied Mathematics; containing Propositions, Formulæ, and Methods of Analysis, with Abridged Demonstrations. By G. S. Carr, B.A. Vol. i. Pp. xxiv. 256. (London: C. Hodgson and Son, 1880.)

WE shall not enter upon any discussion as to the utility or inutility of such a work as the present, but simply confine ourselves to an account of its contents. It is not a work of yesterday, for the author tells us that it is compiled from notes "made at various periods of the last fourteen years, and chiefly during the engagements of teaching." Mr. Carr's chief aim has been so to arrange his matter that the student may be assisted in the revision of bookwork, hence he generally confines himself to indicating the main features of a proof or to a mere reference to the theorems by which the proposition is proved. To aid in this end he has employed a system of cross-references, each article being numbered progressively in "large clarendon figures." A feature to which the author rightly draws attention is the compression he has attained without sacrificing clearness in his "last section, in which in the space of twenty-four pages are contained more than the number of propositions usually given in treatises on geometrical conics," together with clear large figures, and in most cases the demonstrations. This, we think, he has done well. This first part he divides into seven sections. The first contains a large collection of mathematical tables (Factor Tables, Values of the Gamma-function, and many other useful and frequently-recurring constants), in addition to an introduction on the C.G.S. system of units. Algebra is treated of in articles 1-380; Theory of Equations, 400-593; Plane Trigonometry, 600-859; Spherical Trigonometry, 870-910; Elementary Geometry, 920-1099; Geometrical Conics, 1151-1267. It will be seen from the above numbering that there are breaks; these have been "purposely made in order to leave room for the insertion of additional matter, if it should be required in a future edition, without disturbing the original numbers and references." It is obvious to object here that the new matter may not fit into the plan adopted in this edition.

Owing to causes which Mr. Carr names, the earlier part of his work contains a rather long list of errata; most of these are pointed out, but not all. The utility of such a work greatly depends upon its reliability for purposes of reference, and our confidence is somewhat shaken when, on opening the work casually, as we did at p. 6, we find "$\log_{10}\pi = 1{\cdot}4971499$, $\log_e\pi = 0{\cdot}6679358$," and this not corrected elsewhere.

Having carefully read the whole of the text, we can say that Mr. Carr has embodied in his book all the most useful propositions in the above subjects, and besides has given many others which do not so frequently turn up in the course of study. The work is printed in a good bold type on good paper, and the figures are admirably drawn.

Estudio Micrográfico ne Algunos Basaltos de Cuidad-Real. Par Don Francisco Quiroga. (Madrid, 1880.)

IN this memoir the author gives an account of the microscopic characters exhibited by the basalts of the volcanic district of the Campos de Calatrava, which basalts he shows to have been erupted in Tertiary times. These rocks appear to belong to Dr. Boricky's classes of the Nepheline-basalts and the Nephelinitoid-basalts, in the former of which the nepheline is fully crystallised, while in the latter it exists as a glassy base in which crystals are beginning to make their appearance. The primary minerals of these rocks are nepheline, augite, magnetite, and olivine, which may be regarded as their essential constituents, and apatite and hornblende, which the author regards as accessory or accidental constituents. The secondary or derivative minerals are kaholite, hinsuite, and hematite, magnetite, serpentine, and aragonite. The memoir is illustrated by a coloured plate of rock-sections.

Il Binomio di Newton. Per Ignazio Cameletti. 7 pp. (Genova, 1880.)

BY performing the successive multiplications and writing, after the following fashion—

$$\begin{array}{rcl} (1+x)^m = & 1+x & (m=1 \\ \cline{2-2} & x+x^2 & m=2 \\ \cline{2-2} & x+x^2 & \\ & x^2+x^3 & m=3, \\ \cline{2-2} \end{array}$$

and so on, the author succeeds in an ingenious manner, by summation of simple series, in getting the successive coefficients of the general expansion, and so proves his theorem, which is—

$$(a+b)^m = a^m + \Sigma_{p=1}^{p=m} \frac{m(m-1)\ldots(m-p+1)}{1 \,.\, 2 \,.\,.\,.\,.\, p} a^{m-p} b^p$$

or the Binomial Theorem of Newton without having recourse to the doctrine of combinations.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*]

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

Photograph of the Nebula in Orion

During the night of September 30 I succeeded in photographing the bright part of the nebula in Orion in the vicinity of the trapezium. The photographs show the mottled appearance of this region distinctly. I intend shortly to publish a detailed description of the negatives. They were taken by the aid of a triple objective of eleven inches aperture made by Alvan Clark and Sons, and corrected especially for the photographic rays. The equatorial stand and driving-clock I constructed myself. The exposure was fifty minutes. Henry Draper

New York, October 2

An Annelidan Entozoon

While examining the intestinal tract of *Megaderma frons* from the Gold Coast, I found coiled up spirally and adhering to the wall of the lower part of the ileum a small parasite about half an inch in length. On placing this under the microscope I was much surprised to find that it belonged to a class of worms (*Annelida*), none of the species of which have hitherto been known as Entozoa, and further that I was unable to refer it to any of the orders of that class.

On showing it to Dr. J. D. Macdonald, F.R.S., he quite agreed with my opinion that it represents a new order of Annelids, and is moreover disposed to consider it as a connecting-link, hitherto wanting, between the *Chætopoda* and the true leeches.

The specimen in question is about half an inch in length without distinct segmentation, except what is indicated by the perfectly regular disposition of the cephalo-somatic appendages—seventy-three pairs, extending from the anterior almost to the posterior extremity of the body—whereof those occupying the anterior attenuated fourth of the body are fin-like lamellæ, apparently branchial, with a single unarmed mouth not provided with a proboscis, with the intestine spirally coiled round the ovarian tube and terminating inferiorly at the posterior extremity of the body.

Megaderma frons, the host of this remarkable annelid, is a species of bat of very peculiar aspect, which is apparently widely distributed throughout and restricted to the tropical parts of the Ethiopian region. It belongs to a genus whereof one of the species at least is known to suck the blood of smaller bats, which it captures on the wing (see my "Monograph of the Asiatic Chiroptera," p. 77), and as all the species closely resemble one another in structure, it is exceedingly probable that they have all much the same habits.

Although I found remains of insects in the intestinal canal of the specimen from which the above-noticed parasite was taken, yet there was also mixed up with them a large quantity of hair, not from its own body, but evidently (judging from its microscopic structure) that of some other bat on which very likely it had been feeding. It is also worthy of notice that the intestine of the parasite is filled with a reddish matter like the remains of blood.

I have handed over this very interesting specimen to Dr. Macdonald, who will shortly publish a full description of it with figures. G. E. Dobson

Royal Victoria Hospital, Netley, October 7

Sounds made by Ants

From the very interesting remarks lately made by Sir John Lubbock regarding the habits and capabilities of ants, I gather that he seems to consider them as a silent group. The modes of producing sounds among insects are as various as beautiful, whether by internal or external agency. As a rule the larger animals produce sound by internal means, *i.e.* voice, and insects by some external means.

Among ants I know of two varieties or distinct kinds, a black and brown, that make a concerted noise loud enough to be heard by a human being at twenty or thirty feet distance, and which sound is produced by each ant scraping the horny apex of the abdomen three times in rapid succession on the dry crisp leaves of which the nest is usually composed.

The noise made by a single ant is sufficiently loud to be heard on a very dry leaf if attention is directed to it, and no doubt by this means of a vibrating medium they can without special auditory organs communicate with each other. I had the honour of first discovering that the great *Mygale stridulans* made a noise; the apparatus by which it was produced was discovered and fully described by Mr. J. Wood Mason of the Indian Museum, and I should be glad if I am the means of making a similar discovery regarding ants. White ants (so-called) make a noise which is audible—if put on crisp paper—by suddenly shaking the whole body, and seem to warn each other by this means.

Sapakati, Sibsagor, Asam, August 20 S. E. Peal

Faraday Exhibiting Ghosts

Mr. J. Innes Rogers' communication on a "Spectre of the Brocken at home" reminds me of a passage in Dr. Bence Jones's "Memoir of Faraday," vol. i. p. 422.

Faraday's niece, Miss Reid, thus writes: "One evening a thick white mist rose and completely hid everything before us. About ten o'clock my uncle called me into his room to see a spectre. He placed the candle behind us as we stood at the window, and there, opposite to us, appeared two gigantic shadowy beings, who imitated every movement that we made."

Ardchapel, N.B., October 16 W. S.

Ice under Pressure

In reply to C. A. M.'s letter of last week I would make the following remarks:—Ice is not an exceptional substance, for mercuric chloride has also given experimentally the same results, and though I have not yet had the opportunity of submitting other substances to the same conditions, yet I conclude from other experiments that all the bodies which I have so far investigated, and which are of the most varied description, will also exhibit the same phenomenon. As I have not yet published my detailed results, I do not wish at present to enter more fully into the subject, but I may say that the influence of pressure in the present case is not of the same kind as that referred to by C. A. M. as occurring in the text-book named, for the following amongst other reasons. From Prof. Thompson's prediction and Sir Wm. Thomson's experiments it resulted that the melting-point of ice is lowered by pressure, and lowered in proportion to the pressure, whereas in my experiments, at any rate so far as I have at present seen, we do not *vary* the melting-point by diminishing the pressure, but we prevent the substance from melting at all. If the pressure be increased even but slightly above the critical pressure, the ice melts at its ordinary melting-point. The influence of pressure in this case is not one of degree varying with the amount by which the pressure is reduced. The two cases are, I consider, entirely different, and are not contradictions. Similar remarks would probably apply to paraffin and spermaceti, though these are bodies which have not come within the range of my experiments.

Firth College, Sheffield, October 6 Thos. Carnelley

A Peat Bed in the Drift at Oldham

In Nature, vol. xxii. p. 460, there is a letter by Mr. Jas. Nield, giving an interesting description of unique, or nearly unique, appearances in the boulder clay near Oldham. It appears that this glacial deposit has one or more beds of peat, or fragments of peat, intercalated along with it at various depths, leading to the inference that the clay had been stirred up and the fragments of peat had in some manner been mixed with it. That peat bogs, or surface black peaty mould, had existed at no great distance is a conclusion forced upon us, and that the action of ice and snow, probably during a submergence, had mashed up the clay and distributed the peat amongst it. The boulder clay, and the scratched mountain sides, and the travelled fragments of rock, do not extend over the whole of England. It used to be said by geologists that the effects of a severe Arctic climate could not be detected south of a line drawn across the country from London to Bristol; by which it was inferred that all the land north of that line had been under water, subject to the influences of snow and floating icebergs, and all the country south of it above water and clear of those influences. Since then the large granite boulder on the shore of Barnstaple Bay, estimated to weigh ten tons, has been brought more prominently under our notice by Mr. W. Pengelly (*Trans.* Dev. Assoc. vi. 211), and several others by Mr. T. M. Hall (*Id.* xi. 429), discovered by excavation. All these are travelled blocks, and probably ice-borne. Many attempts have been made by ardent and intelligent students of late years to detect proofs of glacial action further south, and even to the shores of the British Channel, but hitherto with doubtful success. There lies on the greensand of Haldon, near Exeter, and on the Blackdown Hills, stretching away towards the south-east corner of the county of Devon, a stratum of tough yellow clay full of white flints, mostly angular. About Haldon and eastward over Pitminster and Churchstanton, many white quartz rounded pebbles, foreign to the accompanying beds, are met with. Farther south, between Honiton and the sea, this stratum of flints and clay in some places is seen to be from forty to fifty feet thick, and the best section of it is in the gravel pits near the cliff on Peak Hill, on the west of Sidmouth. By some persons this deposit has been regarded as the thinned-out edge of the plastic clay formation, containing the remaining flints of the washed-out chalk, still found more perfect at Beer Head, a few miles east. Whether it was this, or whether it was a boulder clay, so called, it is well to remark that, though thickest on the flat tops of the hills, it seems to lap down over their sides, as if it had been deposited after the valleys and the elevations had come to their present conformation; and at two places at least to be visible in the valley of Sidmouth—one under the great blocks of breccia in the orchard near the brook on the Boomer or Boughmoor Estate, and the other on a subordinate hill in a grass field, at about 200 yards from Jenny Pine's Corner, walking down the new road towards Cotmaton, and on the right-hand side. Most of this latter patch of clay and flints was dug away two or three years ago to assist in forming the new road.

When engaged in making certain trenches and excavations on the top of Salcombe Hill in 1879 for archæological purposes (see *Proceedings* Soc. Antiq. Lon. viii. 209) it appeared that the yellow clay, to the depth of two or three feet, was not so much encumbered with flints as deeper down. But whilst thus engaged, what struck me as rather strange was that numerous fragments of black peat were more or less generally but irregularly distributed through the upper two feet; and bearing in mind Mr. Nield's letter, I have in my foregoing remarks been trying to lead up to this point. The cases may not be similar, but they are worth comparing. The land on the top of the hill at this place still bears its wild growth of heath and furze, and has never been subjected to the plough or to cultivation of any sort; so that the clay has not been disturbed by the hand of man. It is too soon to say that this capping of clay and flints is of glacial origin; but some of the indications that have suggested the idea may be observed in the section in the gravel pits on Peak Hill, especially when fresh dug down. They are: (1) that no horizontal bedding is visible, as there would be if the deposit had been made in a large body of undisturbed water; (2) That, on the contrary, waving and distorted lines are sometimes very plain, one instance of which I carefully sketched and coloured in January, 1875; (3) and that the long axes of the embedded flints do not as a rule lie horizontally, as they would necessarily do if they had settled at the bottom of a sea or pond, just as an egg will lie on its side, and not on its point, but they are distributed through the soft mass at all angles, as raisins lie in a pudding that has been kneaded up together.

My object in this communication has been merely to compare the case of the peat mixed with the clay on Salcombe Hill with the somewhat similar case occurring near Oldham.

P. O. HUTCHINSON

Old Chancel, Sidmouth, Devon, October 4

IN NATURE, vol. xxii. p. 511, I find a letter from Mr. G. H. Morton, in which he expresses an opinion contrary to that expressed by me (vol. xxii. p. 460), as to the age of the "peat bed in the drift of Oldham." The section therein alluded to is fairly described by him, but I am surprised that he should for an instant entertain the belief that the clay "has simply slipped down off the sand on to the surface of the peat at a lower level." Had the clay slipped down we ought to have been able to see some indications of the conjectured displacement. Let me say, however, that during my repeated visits to the place and my examinations of the section I have utterly failed to perceive any trace of such indications, and, moreover, I do not remember that one person out of some scores who have in presence of the section pointed out to me the slightest appearance of disturbance. There is not a broken or crumpled line in the whole section.

The peat bed, and indeed the whole of the section, is now, I am sorry to say, covered up; but in and about Oldham we have a large area covered by what I believe to be typical beds of the "Middle" and the bottom of the Upper Drift—alternations of gravel, pebbles, fine and coarse sand, the latter showing lines of "current bedding," and occasionally clay with boulders—in which many similar sections, but wanting in the peat, of course, may be seen, and in which the position and surroundings of the beds quite forbid the possibility of "slipping." The idea of the upper clay "having been excavated and thrown down" is, I think, too improbable to be seriously entertained, seeing that the surface-soil and subsoil on the top of it are of the usual thickness common to the neighbourhood.

The "blue silt" alluded to by Mr. Morton as giving strength to his suspicions, I can assure him is one of the supports upon which I rest my opinion that there has been no disturbance. Do I understand him to mean that the silt is the result of the washings of some passing stream? If so, let me recommend him to visit the railway cutting across the large peat bog a few miles from here, and known as the "Ashton Moss," where he will find, at the bottom of a bed of recent peat, of from two to three yards in thickness, a thicker, but in every other respect a similar band of blue silt, upon which the peat rests throughout the length of the whole cutting. This silt seems to have its equivalent in the "floor clay" which accompanies our seams of coal. I believe that the removal of so much of the peat bed and drift deposits from the face of the excavation as has already taken place has served all the purposes of the "few hours digging at a right angle to the present exposure," suggested by Mr. Morton.

Perhaps a more complete acquaintance with the Oldham drift beds would bring Mr. Morton nearer to my way of thinking. I shall be glad to see him here again, and to assist him in making a wider, and more thorough examination of them.

29, Radclyffe Street, Oldham, October 7 JAMES NIELD

Temperature of the Breath

MR. McNALLY has, it appears to me, missed the point of my observations on this subject.

His own experiments, though they show a temperature obtained by breathing on a thermometer through silk, wool, and linen, considerably above the accepted temperature of the breath, are by no means an exact repetition of mine. He only breathed through four folds of the material for three minutes. I breathed through a much greater amount of material and for a longer time, viz., twenty to thirty folds tightly encircling the thermometer bulb for five minutes.

The temperatures I obtained were very much higher than those observed by your correspondent. Thus on a warm summer day the temperature obtained on rising in the morning before dressing and before eating was 106°. In the afternoon, after playing a game of golf, when returning home by rail with all the windows open, the temperature observed was 107°. The same day, after dinner (without alcoholic stimulants), the thermometer rose to 108° when breathed on in the way described. The temperature of the air that day averaged 70°. Since then I have not obtained a higher temperature than 107°·5.

These temperatures were obtained by breathing through a silk pocket-handkerchief tightly rolled round the thermometer, but I have obtained temperatures nearly as high when the thermometer was wrapped up in cotton or woollen stuff.

Mr. McNally asserts that the explanation suggested by my friend that the high temperature thus obtained was owing to the heat evolved by the condensation of the aqueous vapour contained in the breath is "undoubtedly correct," but he gives no answer to the obvious objection to this explanation, viz., that if the real temperature of the breath be, as stated in physiological works, 95° to 97°, condensation of the aqueous vapour in it would only take place as long as the material through which it is propelled was of lower temperature than the breath. When the material attained a higher temperature than 97° the aqueous vapour, in place of being condensed, and thus evolving heat, would be still further evaporated, and hence be a cause of reduction of temperature.

The fact that woollen clothing prevents chill after exercise has no bearing on the subject of the high temperatures obtained by breathing through woven material on the bulb of a thermometer, for no one has yet observed that woollen clothing will develop a heat greater than that of the body it covers, viz., 98°·5.

The hygroscopic properties of different materials afford no explanation of the phenomena, for the power of materials to imbibe moisture will not account for an increase of their temperature by breathing through them.

My speculations may be right or wrong; Mr. McNally has not shown them to be either. My facts are not the less true from being incompatible with "ascertained physiological truths," for ascertained physiological truths are only true so long as they are not controverted by other ascertained physiological truths.

My experiments show that the temperature obtained by breathing on the thermometer in the manner described is higher when less caloric is abstracted from the surface of the body, lower when the surface of the body is losing more caloric. Thus on a warm summer day my breath raised the thermometer to 108°, whereas to-day (a cold wet day) it only raised the thermometer up to 103°. Does not this seem to show that respiration is a means of getting rid of the superfluous caloric generated in the body, and that when this excess of caloric cannot be got rid of by the skin it passes off by the breath? R. E. DUDGEON

October 9

Selenium

As the only chance of being able to transmit images of reflection through a conducting wire, in the way sound is repeated to a distance by telephone, appears to lie in the preparation of a fairly transparent sheet of metallic selenium; it may tend to advance the subject if the difficulties experienced in dealing with this substance are mentioned.

Selenium in its vitreous condition melts about 220° Fahrenheit, and can be drawn out between mica plates over a lamp, to a thin transparent red film. But heated for some time it turns black and granular, apparently absorbing hydrogen, then melts only at 423° F., and is brittle and intractable. Unfortunately it is only in this crystalline state that its power of conducting electricity appears, and varies with the light under which the selenium is placed.

Prepared in the mass, electrically conducting selenium is as compact as the hardest gas carbon, with the shiny appearance and surface of graphite. How to reduce such a substance to any degree of transparency is perplexing. By reducing it to fine powder, and subjecting the black selenium to severe hydraulic pressure between hot polished steel plates, the desired effect might be produced. Selenium also dissolves freely in chloride of selenium, Se_2Cl_2, and precipitates slowly in a botyroidal mass of black selenium. It also separates in the crystalline form from concentrated solutions of selenide of potassium or sodium.

There is some uncertainty as to whether a transparent sheet could be more easily obtained by the method of precipitation, than by mere mechanical treatment. But the investigation is one that requires to be carried out with the aid of a fully equipped laboratory, and is beyond the power of an ordinary experimentalist.

To devise a successful mode of making a black substance like graphite at all translucent, requires a distinct understanding of the reason why bodies are opaque. Something more than an explanation in general terms is needed before camera pictures can be resolved into electric currents, and again integrated upon a receiving plate.

Perhaps some of the readers of NATURE may be able to suggest a method of dealing with selenium that will produce thin transparent sheets capable of conducting electricity.

London, October 16 A. T. F.

Dynastes Hercules

THE reviewer of Ober's "Camps in the Caribbees" (NATURE, vol. xxii. p. 216) appears to doubt the story of the habits of the large Hercules beetle, *Dynastes hercules*, given by Ober on the authority of his guide. It is nevertheless perfectly true, and I have myself witnessed the occurrence twice in this neighbourhood, where the beetle is not uncommon. In the first instance I noticed it on a branch of *Ochroma lagopus*, and the second time on a species of *Bombax*, both very soft-wooded trees. The branches in each case were about three-quarters of an inch in diameter, half an inch being formed by the wood. In both cases I saw the performance of the animal most distinctly, just as described by Ober's guide, and I took not only a piece of the severed branch with me, but secured also the second animal. The noise is not so much produced by the cutting of the branch as by the open wings passing rapidly through the air during the rotation of the beetle. I do not believe there is anything of a sexual call in the manœuvre. The beetle wants to get at the abundant juice of the young branches. It is called in this country *aserrador, i.e. sawyer*. *Golofa porteri*, an allied insect of the same family as Lamellicornes, behaves in a similar way, but chooses of course thinner branches. A. ERNST

Carácas September 9

What is Alrese?

IN the large *Encyclopédie* published by Diderot and d'Alembert, vol. xii. p. 224 (edit. in folio) there is mentioned amongst the substances used for poisoning water to catch the fish, *l'herbe qu'on appelle l'*ALRESE. Littré has no such word, nor anything like it, nor indeed any other lexicographer I am able to consult here. I should be much obliged for any information on this name, or the plant referred to. A. ERNST

Carácas, September 9

Rainfall of Sierra Leone

As I believe there is little account taken of this climate at home, and as perhaps it might interest you, I send you an account of one day's rainfall this month, which is an excessive amount even for Freetown, and equal to one-third the whole year's rainfall for Dublin, I believe:—

Rainfall registered in the Colonial Hospital, Freetown, 50 *feet above Sea-level*

	Inches.
From 6 a.m. to 4 p.m. September 11	6·35
From 4 p.m. to 6 a.m. September 12	4·05
Total in 24 hours	10·4

Garrison House, Freetown, W. HUME HART,
September 16 Colonial Surgeon

An Octopus

I INCLOSE an account of an enormous octopus which was thrown on the shore at Kilkee, Co. Clare, in the last great storm. As strangers find my uncle's hand very hard to read, I have copied his letter.

Ardanoir Foynes C. G. O'BRIEN

"*Saturday, October* 9, 1880

"I am sorry you were not at Kilkee when a great octopus was stranded on the side of the Duggerna reef on Thursday last. Its arms had been partially broken: there were eight of them, each as thick as a strong man's upper arm, and beneath each were two rows of suckers like cupping-glasses, more than a shilling size in circuit. When perfect, each of these arms must have been from twelve to fifteen feet long, and from the point of one arm to that of its opposite was a length of nearly thirty feet. The animal's length from the insertion of its suckers to the end of its body must have been nearly twenty feet, perhaps more. Its mouth, like a parrot's beak, was as large as two joined hands of a large man with the fingers outstretched. It weighed about 4 cwt. Its head was 1½ inch in diameter, about three feet long; its eyes of the size of the inner circuit of a breakfast-plate. A monster. The under colour that of the under side of a turbot." —(*From a letter of the* Rev. R. J. GABBETT.)

SYNTHESIS OF CITRIC ACID

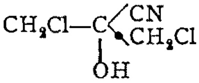
AS we intimated last week, another brilliant synthesis has recently been accomplished in the domain of organic chemistry. Messrs. Grimaux and Adam have succeeded in building up the characteristic acid of lemons from glycerin. Glycerin may be regarded as trihydroxypropane, $C_3H_5(OH)_3$, and citric acid as hydroxypropanetricarboxylic acid, $C_3H_4(OH)(CO_2H)_3$. To convert glycerin into citric acid it was therefore necessary to replace two hydroxyl groups, and one hydrogen atom, by the group CO_2H (carboxyl). This was done as follows:—By the action of hydrochloric acid on glycerin, dichlorhydrin,

$$CH_2Cl—CH(OH)—CH_2Cl$$

was produced; this was oxidised by potassium dichromate and sulphuric acid, to dichloracetone,

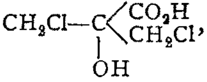
$$CH_2Cl—CO—CH_2Cl,$$

which, when acted on by concentrated hydrocyanic acid, yielded dichloracetone cyanhydrin,



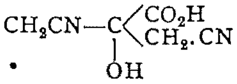
$$CH_2Cl—\overset{\displaystyle\underset{|}{}}{C}\!\!\left\langle\begin{matrix}CN\\CH_2Cl\end{matrix}\right. \quad \text{(C bonded to OH below)}$$

The acid corresponding to this cyanhydrin having been produced by saponifying with hydrochloric acid, the sodium salt of this acid, viz.,



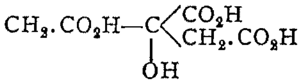
$$\underset{\displaystyle |\atop OH}{CH_2Cl—C}\!\left\langle\begin{matrix}CO_2H\\CH_2Cl\end{matrix}\right.,$$

was treated with potassium cyanide, whereby a dicyanide,



$$\underset{\displaystyle |\atop OH}{CH_2CN—C}\!\left\langle\begin{matrix}CO_2H\\CH_2.CN\end{matrix}\right.$$

was produced. When decomposed by hydrochloric acid this dicyanide yielded citric acid, in all respects identical with that obtained from the lemon and other fruits. The generally accepted structural formula for citric acid, viz.,



$$\underset{\displaystyle |\atop OH}{CH_2.CO_2H—C}\!\left\langle\begin{matrix}CO_2H\\CH_2.CO_2H\end{matrix}\right.$$

is confirmed by the synthesis of Grimaux and Adam. Glycerin may be prepared from trichlorhydrin,

$$CH_2Cl—CHCl—CH_2Cl,$$

which is itself obtained by the action of chlorine in daylight on propylenic chloride,

$$CH_3—CHCl—CH_2Cl,$$

one of the products of the chlorination of propylene, C_3H_6. Finally this hydrocarbon, propylene, may be produced by passing a mixture of carbon monoxide and marsh gas through a red-hot tube. Inasmuch as carbon monoxide and marsh gas are easily built up from carbon, hydrogen, and oxygen, the synthesis of citric acid from these three elements is now an accomplished fact.

In connection with this synthesis, it is worthy of remark that in the last number of the Berlin *Berichte*, Kekulé announces that he has been working at the same subject, but by a totally different method. Kekulé's work is not sufficiently advanced for him to say positively that his method of synthesis is successful, but he feels justified in saying that very probably the process adopted by him has resulted in the formation of citric acid.

M. M. P. M.

PLANTS FROM LAKE NYASSA AND LAKE TANGANYIKA

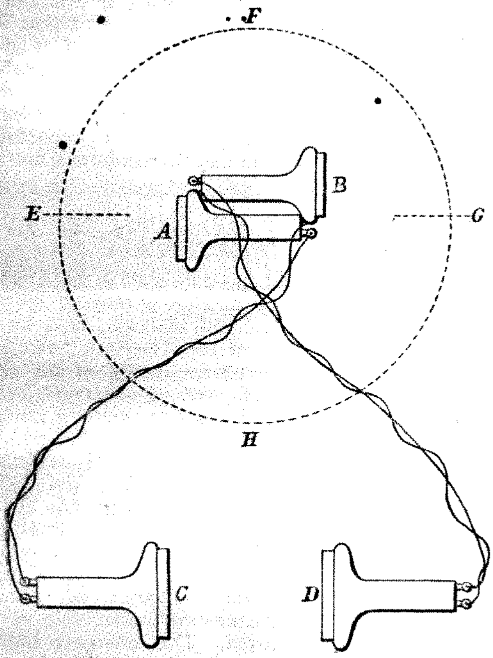
MR. THOMSON, who has recently returned from the expedition of the Royal Geographical Society to Central Africa, has brought to Kew a considerable collection of plants from the plateaux round Lake Nyassa and Lake Tanganyika. The plants from an elevation of 6,000 to 8,000 feet above sea-level contain a large proportion of Cape and characteristically temperate types. Amongst the former are the well-known *Dierama* (*Sparaxis*) *pendula*, *Scilla rigidifolia*, *Buphane toxicaria* (the great poison bulb of Natal and the Transvaal), a fine *Moræa* with a long tube and bright purple flowers as large as those of *Iris fœtidissima*, a *Gladiolus*, a *Pelargonium*, more than one species of *Gnidia* and *Helichrysum*, and a proteaceous shrub (probably *Faurea*, which extends to Abyssynia) with large heads of flowers. Of characteristically temperate types there are species of *Geranium*, *Rumex*, *Cerastium*, *Coalamintha*, and a *Scabiosa*, perhaps identical with our European and English *S. Columbaria*. Upon the plateaux below 6,000 feet the vegetation assumes a sub-tropical character. Here he met with a tree-fern of the genus *Cyathea*, *Agauria salicifolia*, Hook, fil, an ericaceous shrub common to Bourbon, Madagascar, and the Cameroons, representatives of *Mimulopsis*, *Hibiscus*, *Clematis*, *Phyllanthus*, *Gerbera*, *Smithia*, *Acalypha*, *Pentas*, *Thunbergia*, *Buchnera*, *Striga*, a shrubby *Spermacoce*, a curious *Loranthus* with broad leaves and tubular flowers densely clothed with yellow hairs, *Hypoxis Villosa*, several fine Dombeyas, Vernonias, and Combretums, a genus of *Hedysareæ* with flowers in heads like those of the hop, and a curious broad-leaved *Euphorbia*, with very large hand-like glands to the involucre. The specimens are well selected and excellently dried. It is probable that nearly all of them are in a condition in which their botanical position can be settled, and that although upon a hasty glance there do not seem to be any strongly-marked new generic types, a good many of the species will prove new to science. The marked northern extension of the Cape flora at comparatively high elevations in Central Africa is a fact of importance. It quite supports the theory that that flora is of great antiquity, and that what exists of it at the Cape is only a survival from a period when it was probably far more extensively diffused, though perhaps less highly specialised. It is much to be desired that travellers in Central Africa would do all in their power to collect dried specimens of the vegetation of elevations above 6,000 feet.

GRAHAM BELL'S EXPERIMENTS IN BINAURAL AUDITION

PROF. GRAHAM BELL has published in the *American* (quarterly) *Journal of Otology* a memoir on some experiments relating to binaural audition, read by him last autumn at the session of the American Association for the Advancement of Science. Some of his observations confirm the work of previous observers, but are of additional value in affording a more systematic examination of some of the phenomena than has hitherto been attempted. The following summary of the results obtained by him will therefore be of some interest.

When we close one ear and listen to sounds through the other only, there seems to be a onesidedness about them, as there is about objects perceived by one eye. When both ears are employed simultaneously a sort of stereoscopic effect of audition is perceived. Sounds assume a "solidity" which was not perceptible so long as one ear alone was employed. The difference between *monaural* and *binaural* audition is especially well marked when we attempt to decide by ear the *locality* of a particular sound. Whatever power a single ear may possess of determining the direction of a source of sound, both ears are certainly much more effective for this purpose.

The following experiment, designed to produce artificially the stereophonic phenomena of binaural audition, was therefore devised by Prof. Bell while in this country in 1878. Four telephones were arranged, as in the figure. The telephones A and B in one room; C and D in another. The mouthpieces of A and B were turned away from one another like the auricles of a person's ears, and the diaphragms were about as far apart as the tympana of the two ears. The expectation was that a person holding C and D to his ears should not simply hear speech when any one was talking near A and B, but that he should be able to perceive the *direction* of the speaker's voice relatively to A and B. In fact, the listener's ears were, as it were, electrically prolonged to A and B respectively. The sensations produced were decidedly novel; but not exactly such as had been expected. Using various sources of sound—speaking, ringing a loud dinner-bell in various parts of the room, &c.—it was found that the location of the sound could be determined to a limited extent. The general result was as follows: imagine a globe, E, F, G, H, in the interior of which are the telephones A and B; let E and G be the two poles, and imagine the usual meridian lines and parallels of latitude. It was found as the result of the experiments that the observer at C, D could determine with tolerable accuracy the *latitude* of a sound made near A, B, but that *he had no idea whatever of its longitude.* In a later experiment two Blake transmitters were employed. They were placed back to back at about five feet from the ground in the open air. The receiving telephones were indoors, whence the speaker could be observed. The results of observation coincided with those already described. In order more closely to imitate the natural arrangement of the ears the transmitters were then set so that the diaphragms were at 45° to each other. A sound made at H here produced a feebler effect than one made at F; and *after a few experiments* the ear seemed to be able to distinguish whether the speaker were in front of, or behind the transmitters. Unfortunately the two transmitters were not equally sensitive, and the ear had to get accustomed to the slight inequality in the intensity of the transmitted sounds. Prof. Bell suggests that the sensations experienced by deaf persons might be studied by persons possessed of normal hearing powers by purposely using transmitters of unequal power, or by introducing artificial resistances into the circuits.



It also occurred to Prof. Bell that the telephone might afford a means of ascertaining to what degree the human ear normally has the power of appreciating the *direction* of sound. For this purpose a number of telephones were hung up in different parts of a summer-house, and were connected with a switch-board so that an interrupted current from a rheotome in a distant place could be sent through any one at will. A person stationed at the middle of the summer-house, with his eyes closed, and holding his head perfectly still, was required to indicate the point from which the sound seemed to emanate. The indicated direction usually differed considerably from the true direction, and it was found that the observer soon came to recognise each individual telephone by its particular timbre. To obviate this a single telephone was hung up in different parts of the summer-house during the absence of the observer. This was very laborious; nevertheless a long series of experiments were carried out, and their results carefully set down in a series of eight tables. Five young men were employed as observers, the power of each of their ears being previously ascertained by an independent test. The experiments thus carefully made and tabulated are still too few, and in Prof. Bell's opinion too imperfect in several respects, to admit of accurate generalisation; but some deductions are unmistakable. The tables establish beyond dispute (*a*) that the perception of the direction of a source of sound is less perfect by a single ear than by both ears; (*b*) they disprove the idea that direction cannot be appreciated by monaural observation; (*c*) they show that the direction of sound is more accurately defined as it approximates to the axial line of the ears [this entirely negatives Steinhäuser's theory of binaural audition]; (*d*) that the indications are proportionately at fault as the true source is in any other direction, the angular error sometimes amounting to 180° when the source is 90° from the axial line! (*e*) the perception of direction is absolutely unreliable when the source of sound is at the nadir with respect to the observer. It should however be remembered that in experiments thus made in an apartment reflexion of the sound comes into play, and partially vitiates any general deductions by introducing slight though unknown complications.

The method adopted by Prof. Bell to measure the relative hearing power of the separate ears was as follows:—Two flat coils of wire were placed upon a long wooden rod which passed through their centres. One of these coils, the "primary," was a fixture, and was put in circuit with a battery and a vibrating interrupter in a distant room. The other coil, the "secondary," was joined up to a telephone. When placed close to the primary the induced current produced loud sounds; the observer, holding the telephone to his ear, was then directed to slide the secondary coil away from the primary until he ceased to hear anything. The distance between the two coils was then measured. It will be seen that this arrangement anticipated to some extent the sonometer of Prof. Hughes.

We venture to hope that Prof. Bell will continue these interesting researches in this promising, and hitherto almost unexplored field.

S. P. T.

THE GEOLOGY OF THE LIBYAN DESERT[1]

IN his very interesting anniversary address before the Academy of Sciences in Munich Dr. Zittel has brought together all the known facts concerning the geology of the northern districts of Africa, in a manner which is calculated to render the greatest service to his fellow-workers in science. The address, with its accompanying map and numerous explanatory notes, constitutes indeed by far the best monograph on North African geology which has yet appeared. The author not only reviews the works of the various travellers who have furnished materials bearing upon the question, from Browne and Hornemann to Fraas, Rohlfs, and Schweinfurth, but what is of far more importance, gives the results of his own accurate study of the rocks and fossils collected and brought home by recent investigators. The general results arrived at by Dr. Zittel are as follows.

To the east of the Nile rises a mountain range composed of highly crystalline rocks—granite, diorite, and hornblendic gneiss. The peaks of this range rise to heights varying from 5,000 to 8,000 feet.

The oldest stratified rocks of the district appear to be of Cretaceous age. Lying upon the axis of crystalline rocks, and also covering wide tracts of country to the south of the Great Desert, is found the Nubian sandstone formation. Concerning the age of these sandstone rocks a considerable amount of controversy has taken place in recent years, and they have been referred by different authors to the Triassic, the Jurassic, and the Neocomian systems. The fossils found by Overweg and others, however, seem to leave no room for doubt that the real age of the Nubian sandstone is the Cenomanian, or lower portion of the Upper Cretaceous.

---

[1] "Ueber den geologischen Bau der libyschen Wüste. (Festrede gehalten in der öffentlichen Sitzung der k. b Akademie der Wissenschaften zu München zur Feier ihres einhundert und einundzwanzigsten Stiftungstages.) Von Dr. Karl A. Zittel.

Lying upon these sandstones are found great deposits over 600 feet in thickness, consisting of dark green and grey, finely-laminated marls in their lower, and of white, earthy limestones in their upper part. These rocks contain many characteristic Upper Cretaceous fossils, such as *Ananchytes ovatus*, *Ventriculites*, and *Rudistes*. These Upper Cretaceous rocks have been found not only forming the whole southern margin of the Desert, but also rising above the sandy wastes in the hilly masses which form the oases.

The deposits which underlie the greater part of the Sahara appear to be of Tertiary age and referable to the Nummulitic and Miocene periods. There would seem to be no sharp line of demarcation between the Cretaceous and the Tertiary deposits in this area, and in this, as in many other particulars, which are pointed out by Prof. Zittel, the North African formations of these periods remind us of those of [the Rocky-Mountain regions of North America.

The older Tertiary deposits of Northern Africa are divided by Dr. Zittel into two members, which he designates the "Lybysche Stufe" and the "Mokattam Stufe." In the lowest of these (the Libysche Stufe) a widely-spread and very characteristic fossil is the Belemnite-like *Graphularia desertorum*, Zitt.; many nummulites and other well-marked Eocene fossils also occur.

There appears to be still some doubt as to whether the "Mokattam Stufe" of Dr. Zittel should be classed as Eocene or Oligocene.

In the northern part of the area various freshwater and marine deposits are found which are now referred to the Miocene. No less than sixty-eight forms of marine mollusca have been determined by Dr. Theodor Fuchs as occurring in these beds, and he is led to regard them as indicating a horizon not far removed from that of the Leitha-kalke of the Vienna basin.

The several formations described succeed one another from south to north, this being the direction of the dip of the beds; their relations to one another are well illustrated in the map and sections which accompany the work.

In the midst of the Beharieh oasis a mass of igneous rock is found rising through the midst of the Upper Cretaceous limestones. This rock has been studied by Prof. Zirkel of Leipzic, who pronounces it to be an ordinary plagioclase basalt, very similar in character to that of the Giant's Causeway in Ireland.

Over the whole of these formations the great mass of sands of the Desert is spread, and rises in places into hills several hundreds of feet in height.

In reading this address we cannot but feel that Dr. Zirkel has made admirable use of the collections which Dr. Schweinfurth and others have placed in the museum at Munich; and that by their careful study he has been enabled to clear up many of the difficulties which every one must have felt who has endeavoured to understand the geological structure of the great African continent.

PHYSICS WITHOUT APPARATUS[1]

VIII.

IN the *preceding* articles of this series we have shown how in every department of physics a large number of instructive experiments may be performed without the aid of any more formal apparatus than the usual domestic appliances of an ordinary household. There remain to be described a few miscellaneous experiments before concluding the subject.

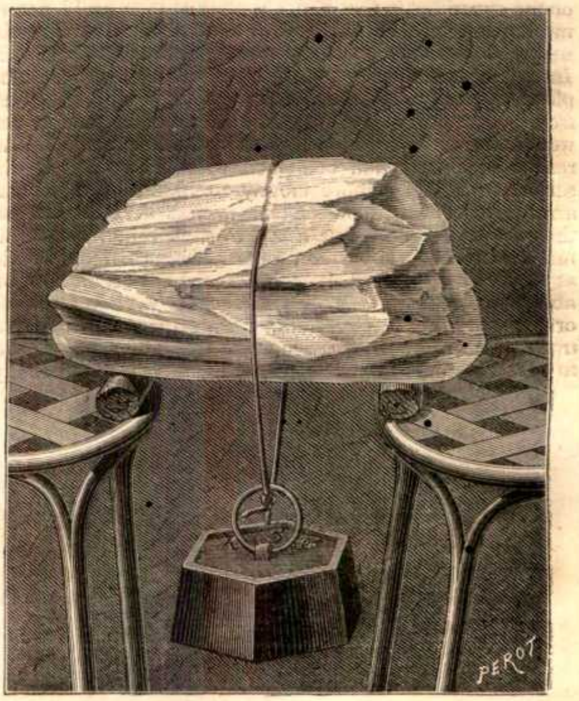


FIG. 25.

Many years ago Prof. Faraday observed that if two pieces of ice are pressed against one another they freeze firmly together at the point of contact, even though they may themselves be thawing at the surface. To this

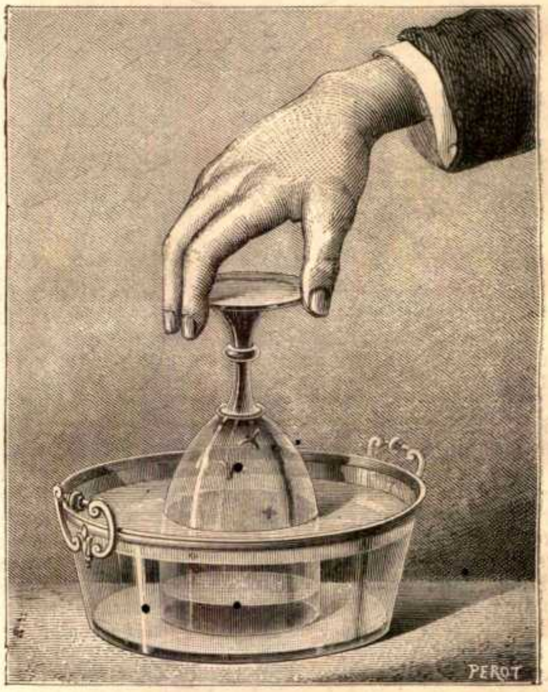

FIG. 26.

---

[1] Continued from p. 518.

peculiar property of ice he gave the name of *regelation*. The true explanation of this property was not at once arrived at. From theoretical considerations Prof. James Thomson was led to predict that the application of pressure to ice would lower the temperature of its melting-point, and cause it to melt even though as cold as, or colder than, the usual "freezing-point." This prediction was afterwards verified by Sir William Thomson, who melted ice by subjecting it to great pressure. More recently Mr. James Bottomley has devised a very beautiful experiment on regelation which requires no special apparatus for its performance. A block of ice (Fig. 25) is placed upon a suitable support, and over it is hung by a copper wire a heavy weight. It is found that in the course of a few hours the weight will have dragged the wire through the ice, as if it were no harder than a piece of cheese, yet that the ice has healed up as fast as the wire cut into it, and that it is still one solid block. This extraordinary fact can be accounted for in the following way. In the neighbourhood of the wire where it passes through the ice the pressures are not uniform, for just below the wire the portions of the ice are under pressure, owing to the pull of the heavy weight, while immediately above the wire the ice is subjected to a stress tending to draw the particles asunder, or, in other words, it is subjected to a *pull* or "negative pressure." The pressure on the ice under the wire lowers its melting-point, and causes very small quantities of it to melt; these liquid portions immediately are squeezed out, and find their way round the wire to the space above it, where, the pressure being reduced, they again freeze hard.

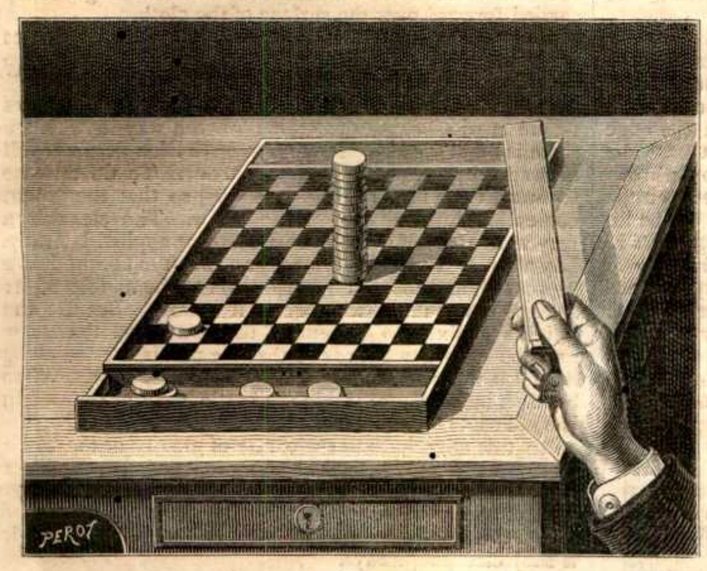

FIG. 27.

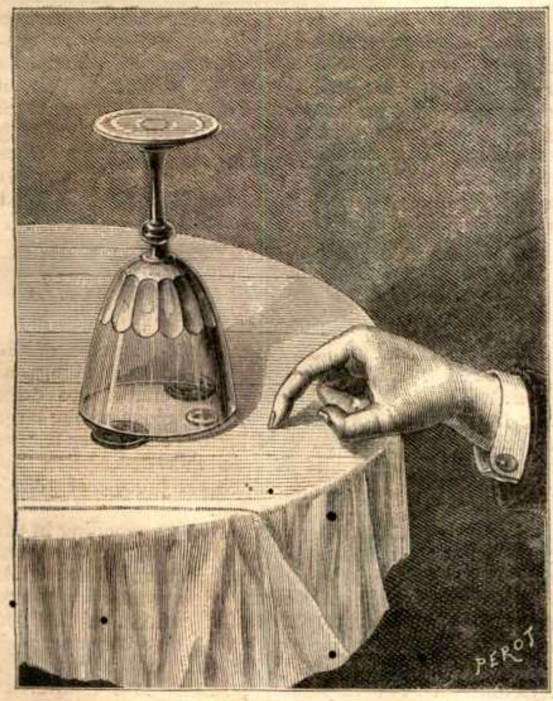

FIG. 28.

Our next picture (Fig. 26) is a simple illustration of the principle of the diving-bell. A wine-glass is turned mouth downwards and plunged into a jar of water. The water rises up only a very little way into the mouth of the wine-glass, owing to the air which it contains. The deeper the wine-glass is plunged the more is the air compressed and the higher does the water rise in the miniature bell. To compress the contained air into one-half of its original volume it would be necessary to plunge the wine-glass about thirty-four feet deep into water; for to halve the volume of the air inside we must double the external pressure. The pressure of the air is already about fifteen pounds on every square inch, and to double that pressure requires the additional weight of thirty-four feet of superincumbent water, for that is the depth at which the water itself presses with a force of fifteen

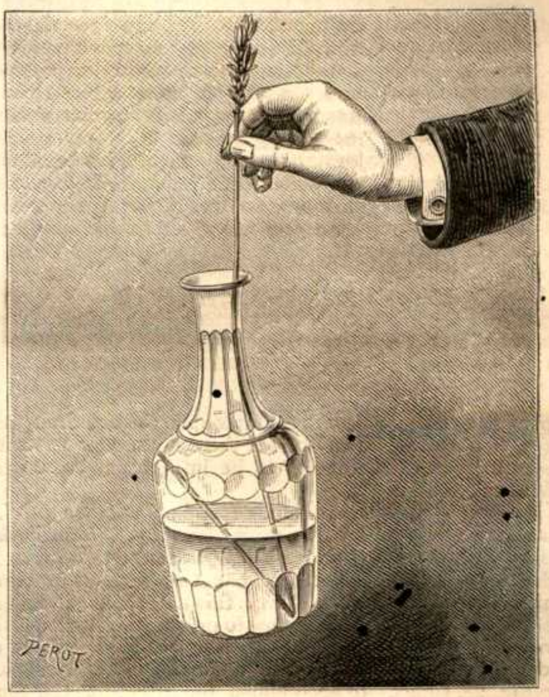

FIG. 29.

pounds on each square inch of surface. M. Tissandier, in describing this simple experiment in the pages of *La Nature*, has suggested that a few imprisoned flies or other insects may without any cruelty or hurt do duty as divers within the miniature diving-bell, and afford proof that life can go on in the inclosed air even though below the surface of water.

In speaking in a former article of the subject of *inertia* we mentioned the following familiar trick: a number of the round wooden "men" used in playing the game of draughts are piled up in a column one upon another. If the lowest one of the pile is dextrously hit with the edge of a paper-knife or other suitable article it may be knocked away from under the others without overthrowing the others. Fig. 27 shows how the experiment is arranged, the narrow slip of wood which serves as the lid of the box being here used as the weapon. Beginners in science must not mistake the meaning of the term *inertia* as applied to matter. Matter is not in itself lazy or inert. But it possesses the property of *mass*, and to set mass in motion requires the expenditure of *energy*. If we skilfully spend the energy of the rapid blow upon the one draughtsman, it is knocked away before there is time for any considerable part of the energy to be imparted to the others that are piled upon it.

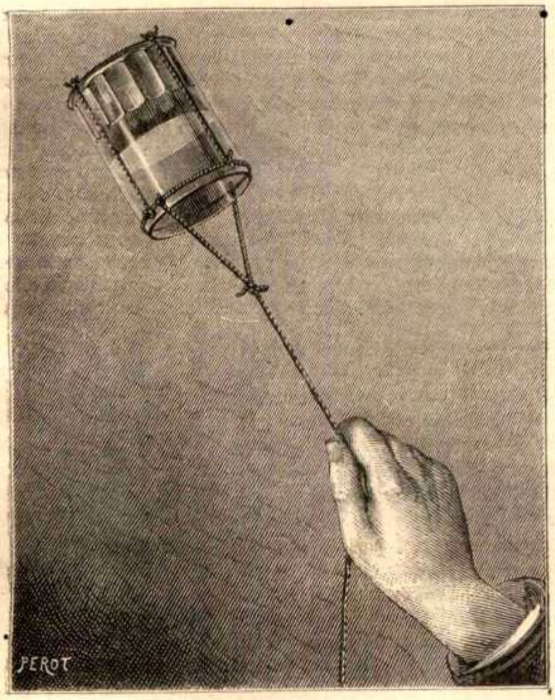

Fig. 30.

Another simple experiment, depending partly upon the inertia of matter and partly upon elasticity, is often shown as an after-dinner trick. Upon a linen tablecloth is placed a threepenny-piece between two pennies or other larger and thicker coins. Over this an empty wine-glass is placed, and the puzzle is how to get out the smaller coin without touching the glass. The very simple operation of scratching with the finger-nail upon the cloth, as shown in Fig. 28, suffices to accomplish the trick, for the little coin is seen to advance gently towards the finger until it has moved completely away from under the glass. The fibres of the linen cloth are elastic; when you scratch with your finger-nail they are drawn gently forward until the force of their elasticity becomes too great and they fly back, to be once more drawn forward, again to slip back, and so on. While the fibres are drawn forward slowly, they drag the coin with them to a minute distance. But when the slip occurs and they fly backward, they do so very rapidly, and slip back under the coin before there is time for the energy of their movement to be imparted to the coin to set it in motion. So the coin is gradually carried forward over the surface of the cloth.

We will next give a simple experiment which illustrates the principle that a substance which is very weak in one direction may be very strong in another, the "strength" of the material (that is to say, the resistance it offers before it will break) depending on the way in which a force is applied to it. It is possible to lift a decanter full of water by means of a single straw. To do this the straw must be bent as Fig. 29 shows, so that the weight comes longitudinally upon the straw. The straw is a very weak thing if it has to resist a force applied laterally. Lay a single straw horizontally, so that the two ends are supported, and then hang weights on to the middle of it: a very few ounces will break it across. But let the weights be fixed to one end of the straw, and the straw itself be hung downwards so that the pull is exerted along it, and it will support one or two pounds at least. When bent, as in the figure inside the bottle, most of the weight is applied as a thrust against the end of the straw; the bottle tilts slightly until the centre of gravity of the whole is below the point from which it hangs between finger and thumb; but in this position the sideway thrust against the middle of the straw is very small, and the material is strong enough to stand the strain to which it is subjected lengthways.

Lastly we offer an illustration (Fig. 30) of an experiment known to every schoolboy. A can or jar containing water may be whirled round the head without spilling a single drop, provided the motion be sufficiently rapid. When a moving body is subjected to the constraining action of a force which acts, like the pull of a string held in the hand, towards a fixed centre, the result is a motion around the centre of force. Were it not for the constraining force the moving body would fly away at a tangent; and to the reaction exerted successively in all directions away from the centre the name "centrifugal force" was formerly given. The water in the can, being heavy, is also subjected to this so-called centrifugal force as it moves around the fixed centre, and hence it does not fall out of the can while passing through the inverted position in the air if its speed be sufficiently accelerated.

THE GERMINATION OF WELWITSCHIA MIRABILIS

HAVING been supplied, through the kindness of the Director of Kew Gardens, with young seedlings of *Welwitschia mirabilis*, I have been enabled to draw some fresh conclusions as to the homology of the large leaf structures, which have hitherto been described as persistent cotyledons. It is true this description has been confessedly provisional, since the process of germination has not hitherto been traced.

The seeds germinate in a manner corresponding in the main with that described by Strasburger for *Ephedra campylopoda* ("Conif. und Gnet.," p. 320). The radicle first breaks through the testa, the point of perforation depending apparently upon the position of the seed during germination. The cotyledons also break through the testa, but at a different point from the radicle. The cotyledons are two in number; in one case I observed three, one being smaller than the others. They free themselves entirely from the seed, and expand to a length of 1 inch to 1½ inch, with a breadth of ⅛ inch, or rather more; it is possible, however, that they may by growth attain a larger size. The cotyledons when expanded are green, though while still in the seed they are yellow.

Their form is linear, margin entire, glabrous. Each has two main fibro-vascular bundles parallel to one another, and two or more lateral ones, also parallel to these; they all give off lateral bundles which anastomose freely. The hypocotyledonary portion of the stem extends to a length of about one to two inches; it is compressed in a plane parallel to that of the cotyledons, and is slightly swollen immediately below the point of junction with them.

Though the cotyledons are completely withdrawn from the seed at an early stage, a physiological connection is kept up between the seedling and the endosperm by a peculiar structure, produced apparently by a lateral swelling of the hypocotyledonary portion of the stem. The time and manner of its development I have not yet been able to ascertain, but in one seedling of twelve days it was found lying parallel to the cotyledons, these being still inclosed in the endosperm, whereas in the mature seeds I have not been able as yet to see any trace of it.

This structure remains in close connection with the endosperm, and is probably useful in transferring the nutritive substances from it to the embryo after the cotyledons have been withdrawn. As far as I can see at present, this lateral structure is produced merely by a process of lateral extension of tissues. The fibro-vascular bundles curve slightly into the protrusion, but I have observed no special modification of the tissues further than a lateral extension. If this be the case, it may be considered morphologically as an emergence.

It has been already observed by Strasburger ("Angiospermen und Gymnospermen," p. 155, Plate xxii., Figs. 90, 91, 93) that in the ripe embryo of Welwitschia an apical papilla is to be seen between the cotyledons; but his observations were conducted only on embryos in mature but ungerminated seeds; and here, as in other members of the group, the plumule does not develop beyond this condition of a mere papilla till germination begins. In the young seedlings (about six weeks old) which I have had the opportunity of observing, the *plumule consists of two leaves*, decussating with the cotyledons, and between these there is an apical papilla. In the most advanced specimens now growing at Kew these leaves of the plumule are about one-sixteenth of an inch in length, but no further development of leaves is at present to be seen.

These observations suggested a comparison with the youngest specimens preserved in the Kew collections: the result is the discovery of evident traces of the bases of leaf-structures below the well-known pair of large leaves, in the form of ragged ends of fibro-vascular bundles, which run directly into the tissues of the stem. These earlier leaves appear to have been at right angles to those of the existing leaves of the plant, and we may with good reason conjecture that they were the cotyledons. Full proof of this will be afforded if the plants at present growing at Kew remain healthy. If this conjecture be true the pair of large perennial leaves are *the first and only pair of leaves developed from the plumule*, and not cotyledons, as they have been hitherto assumed to be.

Other interesting points in the germination of this plant, together with a description of its minute histology, must be deferred till a later notice. This I hope to be able to publish with illustrations in an early number of the *Quarterly Journal of Microscopical Science*.

October 9

NOTES

In the second of a series of articles in the *Pall Mall Gazette* "On Vain Discourse," in the quaint and leisurely style of our remote forefathers, the writer speaks of "the talker who thinketh he hath a vocation to popularise science, not as some of our masters come forth to stir up interest in these matters, but from folly and emptiness." He then proceeds to define him:—"He is a great breeder of vain discourses, for he deemeth that the strong meat of knowledge will sit ill on dainty stomachs, and so sets himself to save them the digesting. He watereth first to the consistency of a small fact to the page, and sweeteneth with many a line of poetry; and if there be a tough morsel of reasoning or a sharp fragment of logical defining, that he carefully throweth aside, 'et pondera rerum minutissimis verbis frangit.' For seasoning there are divers sorts of lights or colours or smells to wonder at, and pictures and tales, and praise of the wonderful nineteenth century, and of science and of such as study it. And so there is made a thin and limpid pabulum, or *extractum scientiæ dilutum*, which will not harm the delicatest, nor indeed do them any good, though it be sweet to the taste and pleasant to the eyes, and have the savour of wisdom. For knowledge that is worthy of being attained needeth faithful striving and endeavour, and skill cometh not but by assiduity in act and exercise—χαλεπὰ τὰ καλά." The lecture season is now beginning, and it would be well that those who attend science lectures should learn to distinguish between the true and the false, and this they can easily do by applying the test given by the *Pall Mall*. The spread of efficient education in science will either extinguish the popular lecture or greatly alter its character. We are glad to see the growth of outside opinion on the subject, as may be inferred from the article alluded to.

We regret to record the death of Dr. E. J. Sparks, F.R.C.P., of Mentone, which occurred at Crewkerne on the 11th instant. Dr. Sparks has been in failing health for several years, but he is one of those striking instances of what work can be done by an active mind in spite of physical weakness. He was well known as a constant contributor to the *Medical Times*, in which appeared the series of letters on the climate of the Riviera, which were afterwards developed into his excellent book on the Health-Resorts of the Riviera. The preparation of this work occupied the best portion of Dr. Sparks' later years, and it is only three months since he revisited several of the less frequented places on the Eastern Riviera for the sake of a second edition. The book is a truly scientific work. Statistics relating to climate and the various diseases for which the Riviera has been recommended have been collected and tabulated with the greatest diligence and care; and the experience of observers, both lay and medical, as to the beneficial influence of the climate is given with the greatest candour. Besides this work, Dr. Sparks published a few years ago a translation of Dr. King's "Therapeutics," the value of which was greatly enhanced by the introduction of a quantity of new matter carefully collected together from medical periodicals. It was a work of no small labour, necessitating as it did the transformation of all quantitative relations from the German into those employed in the English and American Pharmacopœias. It received on the other side of the Atlantic prompt appreciation in a manner both hurtful and complimentary. Before it could be reprinted from the stereotype plates sent over for the purpose, a pirated fac-simile edition was produced by a publisher who has hitherto forgotten to send a cheque. He brought to his medical practice an unusually thorough knowledge of the science of his profession, and a high-minded devotion to the welfare of his patients which quickly secured the confidence of all who consulted him. In friendship he was staunch, loyal, and self-sacrificing, and his loss will be long felt by a wide circle of friends.

The following are among the scientific and geographical publications announced for the present season:—By Mr. Murray: "Japan; its History, Traditions, and Religions, with the

"Narrative of a Visit in 1872," by Sir E. J. Reed, K.C.B., M.P.; "Unbeaten Tracks in Japan," by Isabella Bird (these works are just published); "Personal Life of David Livingstone," by Dr. W. G. Blackie; "A Pilgrimage to Nejd," by Lady Anne Blunt; "The Power of Movement in Plants," by Charles Darwin, assisted by Francis Darwin; "The Cat; an Introduction to the Study of Back-boned Animals," by St. George Mivart; "Siberia in Europe, a Naturalist's Visit to the Valley of the Petchora," by Henry Seebohm; "The Gardens of the Sun: a Naturalist's Journal on the Mountains and in the Forests and Swamps of Borneo and the Sulu Archipelago," by F. W. Burbidge. Messrs. Allen and Co. announce: "The Expiring Continent; a Narrative of Travel in Senegambia," by A. W. Mitchelson; "A Dictionary of Ethnological and Philological Geography," by Dr. R. G. Latham; "Incidents of a Journey through Nubia to Darfur," by Sydney Ensor, C.E. Among Messrs. Crosby, Lockwood, and Co.'s announcements are: "The Fields of Great Britain; a Text-Book of Agriculture," by Hugh Clements; "A Rudimentary Treatise on Coal and Coal-Mining," by Warington W. Smyth, F.R.S. Messrs. Sampson Low and Co. announce: "New Guinea," by L. M. D'Albertis; "Seven Years in South Africa," by Dr. Holub. Messrs. Longmans promise the second series of Helmholtz's "Popular Lectures on Scientific Subjects," translated by Dr. E. Atkinson. Messrs. Chatto and Windus: "A Simple Treatise on Heat," by W. M. Williams. Macmillan and Co.: "Island Life," by A. R. Wallace; "A Visit to Wazan," by L. S. Watson; "Voyage of the *Vega*," by A. E. Nordenskjold; "Text-Book of Geology," by Prof. Geikie; "Ideal Chemistry," by Sir Benjamin Brodie, Bart.; "A Treatise on Organic Chemistry," by Professors Roscoe and Schorlemmer; vol. ii. of Mr. F. M. Balfour's "Treatise on Comparative Embryology;" "Anthropology," by Dr. E. B. Tylor; "Mathematical Papers," by the late Prof. Clifford; "History of the Steam Engine," by R. L. Galloway.

The inauguration of the Paris Popular Observatory took place at the Trocadéro Palace on October 11, on the second terrace of the Eastern Tower. Four telescopes—three reflectors and a refractor, have been placed at the disposal of the public. No fee is taken from the visitors, who have only to make application to the Popular Observatory Office, Trocadéro, and register their names. A series of lectures on practical observations will soon begin. A room is also reserved for microscopical observations, which will be opened during the daytime.

The Sheffield Public Museum boasts of an equatorially mounted telescope which the public are permitted to use under certain restrictions and under the direction of Mr. E. Howarth, the curator.

M. Hervé-Mangon, the new director of the Conservatoire des Arts et Métiers, gave yesterday a great dinner in honour of Mr. Graham Bell, the inventor of the photophone, which was exhibited and tried in that establishment.

The Calisaya bark plants cultivated in Jamaica appear to have been replaced by an inferior hybrid between true *Cinchona Calisaya* and *C. succirubra*. In order to remedy this state of things Mr. J. E. Howard, F.R.S., the well-known quinologist, liberally placed cuttings from his authentic plant of *Cinchona Ledgeriana* at the disposal of the Royal Gardens, Kew. Three healthy plants raised from this source have lately reached Jamaica, besides others which have been sent to Ceylon.

Camoensia maxima, the most striking leguminous plant known, has flowered for the first time in cultivation in the Botanic Garden, Trinidad, to which it was sent two years ago from Kew. Welwitsch found it abundantly in the forests of Angola. The flowers are nearly a foot long, with a reddish calyx and cream-coloured petals with a golden border. The standard is 3 4 in. broad, which gives some idea of the scale of the other parts. There are living plants also at Kew, but at present it has shown no indication of flowering under glass.

A correspondent states that when he was a schoolboy at Hamburg, male crickets (species not indicated) were sold there in cages made of four playing-cards, and at the rate of a penny a-piece.

Another correspondent states that the electric lamps illuminating a large concert-room in the Champs Elysées at Paris, a year or two ago, were extremely attractive to insects of various orders. Who knows that the Thames Embankment may not become the nightly resort of members of the Entomological Society?

The Committee of the Topographical Society of London, which has been formed for the purpose of collecting and publishing maps, views, and other materials for the history of London, have made arrangements for the holding of the inaugural meeting of the Society on Thursday, the 28th inst., at 4 o'clock. The Lord Mayor has granted the use of the Long Parlour at the Mansion House, and will preside on the occasion. Cards for the meeting may be obtained from Mr. Henry B. Wheatley, F.S.A., 18, John Street, Adelphi, W.C.

We are glad to see a new edition of the late Sir J. W. Lubbock's Star Maps, under the title of "The Stars in Six Maps on the Gnomonic Projection," with explanatory notes by Mr. James Glaisher, F.R.S. Letts, Son, and Co. are the publishers.

It is proposed that an International balloon race should take place at Paris on October 31. Active steps are being taken, and the necessary authorisation will be procured without difficulty from the public authorities, but an obstacle of a quite unexpected nature remains to be solved. For motives, which it is very difficult to determine, the Parisian Company who monopolise the gas, and sell it at the enormous price of threepence per cubic metre, refuse to dispose of the commodity to aeronauts. As no provision in the charter has been made for the right of inflating balloons, it remains to be seen whether or not the gas monopolists will persist in their refusal.

M. Sadi Carnot, the French Minister of Public Works, has appointed a Commission to explore the antiquities of the Regency of Tunis, and determine what works could be executed with advantage in a country of which the welfare is of such importance for the good of the largest French dependency.

The *Pester Lloyd* gives a detailed account of the earthquake which seems to have been felt generally all over Transylvania on the night between the 3rd and 4th inst. From about 7 o'clock in the evening rumbling noises were heard throughout the night, especially in the hilly districts. About 6.15 a.m. a shock was felt which lasted a couple of seconds, and the shock was repeated, in some places twice, in others as often as ten times. Doors were opened and shut, windows rattled, bells were rung. In several places a movement of the ground was felt, in a direction from north-west to south-east; in some places this movement lasted as long as ten seconds. In the neighbourhood of Tövis a small railway-station building was overthrown. At Felvinez the shocks were very severe, lasting fully two minutes. Several public buildings had rents in the walls, and nearly the whole of the ceiling of the Reformed Church fell. At Bistritz the people were so alarmed that they rushed from their beds into the streets and open places. In general the disturbance was greater in the western portion of the province.

An interesting "Note on the Distribution of some of the more important Trees of British Columbia" has been contributed by Mr. George M. Dawson to a recent number of the *Canadian*

Naturalist. In a brief review of the general characters of the vegetation of the country the peculiarities in distribution are pointed out. The arrangement of the trees referred to is not based on any scientific principle, the Coniferæ being "placed first, as having the greatest importance both from an economic point of view and from the vast extent of country which they cover almost to the exclusion of other trees." Considering the variety of well-known timber trees to be found in British Columbia one is scarcely prepared to find it stated, with regard to the Douglas Fir (*Pseudotsuga Douglasii* or *Abies Douglasii*), that it is the "most important timber tree of British Columbia, and the only one of which the wood has yet become an article of export on a large scale." The best grown specimens of this noble tree are stated to be found near the coast in proximity to the waters of the many bays and inlets which indent it. In these situations the tree frequently exceeds eight feet in diameter at some considerable height from the ground, the height of the tree itself ranging from 200 to over 300 feet. "The wood varies considerably in appearance and strength according to its locality of growth and other circumstances. It is admirably adapted for all ordinary purposes of construction, and of late has obtained favourable notice in shipbuilding, remaining sound in water for a long time. For spars and masts it is unsurpassed, both as to strength, straightness, and length. Masts for export are usually hewn to octagonal shape from 20 to 32 inches in diameter by 120 feet long. Yards are generally hewn out from 12 to 24 inches in diameter and 50 to 102 feet long. Masts and spars are generally sent to Great Britain; other forms of timber to South America, Australia, India, China, and the Sandwich Islands. Of the *Thuja gigantea*, which in favourable situations on the coast reaches a height of 100 to 150 feet, the pale yellowish or reddish wood is stated to be very durable, though not extensively used except for shingles. The large and elegant canoes of the Indians are made of the hollowed trunks, and the fibre of the inner bark is used for ropes and cordage, as well as for paper-making and other purposes. One of the most remarkable uses for a wood is referred to under *Pinus contorta*, where it is said that the cambium layer contains much sugar, and for that reason it is eaten by the natives in the spring of the year, and in some instances large quantities of it are collected and dried for winter use.

THE *Boston Herald* gives the following account of an American experiment made on September 2:—"A novel exhibition of powerful electric lights was made last evening in the vicinity of the Sea Foam-house, Nantucket Beach, and the display was witnessed by quite a crowd of interested spectators. The Northern Electric Light Company have erected three wooden towers, each 100 feet high, and mounted upon each of these a circular row of twelve electric lights of the Weston patent, each light being estimated at 2,500-candle power. As these towers are but 500 feet apart and in a triangle, it will be seen that the light of 90,000 candles was concentrated within a limited territory. The design of the exhibition was to afford a model of the plan contemplated for lighting cities from overhead in vast areas, the estimate being that four towers to a square mile of area, each mounting lights aggregating 90,000-candle power, will suffice to flood the territory about with a light almost equal to midday. Last evening a motive power of thirty-six horses was used in generating the electricity from three Western machines, and the lights, with one single slight flicker, burned steadily and brilliantly all the evening. It is difficult to say whether the experiment proved anything or not. The claim put forward by the company is for an original plan of lighting cities and towns by grouping and elevating electric lights of any kind."

WE have received Part 1 of the *Transactions* of the Epping Forest and Essex Field Club, containing Mr. Henry Walker's interesting lecture on "A Day's Elephant Hunting in Essex."

AT the Leeds Philosophical and Literary Society the following are among the lectures to be given this winter:—October 20, Prof. Silvanus P. Thompson, D.Sc., "Waves of Sound and the Photophone"; November 16, H. Clifton Sorby, LL.D., F.R.S., "The Structure and Origin of Meteorites and Meteoric Iron"; December 7, Dr. Sydney H. Vines, "The Nutrition of Plants"; December 21, Prof. E. Ray Lankester, F.R.S., "Degeneration"; February 15, 1881, Prof. T. E. Thorpe, Ph.D., F.R.S., "The Azores"; March 1, J. W. Swan, "The Electric Light, with Demonstrations."

OUR ASTRONOMICAL COLUMN

THE BINARY STAR δ EQUULEI.—Mr. Burnham publishes a new epoch for this star, which there is now good reason to conclude will prove to be the most rapid revolver amongst the binary systems; on this account it well deserves the attention which Mr. Burnham claims for it at the hands of those observers who are in possession of instruments competent to cope with so close a double-star. The duplicity was detected by M. Otto Struve on August 19, 1852, with the Pulkowa refractor, when definition was unusually good, and the components almost equal in magnitude were "à peine séparées par une ligne noire." In 1853 and 1854 it appeared single in the same instrument. The object was elongated in the summer of 1857, and at the date 1858·59 M. Struve saw the stars separated at moments, and they were again divided in the autumn of 1874. As is pointed out in the Pulkowa Observations, vol. ix., the case is evidently a similar one to that of 42 Comæ Beren., the visual ray coinciding very nearly with the plane of the orbit, so that the companion appears to oscillate backwards and forwards almost in a right line, and that of very small extent. M. Struve has established the period of revolution of 42 Comæ to be only about twenty-five years; but δ Equulei appears to indicate a period of only thirteen or fourteen years. Mr. Burnham finds from five nights' measures with the 18½-inch Chicago refractor,

1880·60, Position 29°·1, Distance 0″·35.

In September, 1870, Dunér remarked of this star: "Oblongue, j'en suis bien sur. Les diamètres sont comme 3 : 5," and the angle was estimated 8°. The only measures except Mr. Burnham's are those of M. Otto Struve. The magnitudes of the components are so nearly equal (the American observer considered there was a difference of only about two or three tenths of a magnitude), that care will be necessary to place the smaller star in its proper quadrant. Mr. Burnham adds: "It seems certain that it is measurable with any good instrument of ten inches aperture and upwards at least one year in every six years," and he believes that it is now near its maximum distance.

FAYE'S COMET.—The following positions are extracted from Dr. Axel-Moller's ephemeris for Berlin midnight:—

	R.A.			N.P.D.		Log. distance from	
	h.	m.	s.	°	′	Earth.	Sun.
Oct. 22	22	48	22	88	50·8	0·0506	0·2892
24	—	48	58	89	9·8	0·0532	
26	—	49	43	89	27·8	0·0561	0·2855
28	—	50	37	89	45·0	0·0591	
30	—	51	39	90	1·2	0·0623	0·2819
Nov. 1	—	52	50	90	16·5	0·0656	
3	—	54	9	90	30·7	0·0691	0·2785
5	—	55	37	90	43·8	0·0727	
7	22	57	2	90	55·9	0·0764	0·2751

The comet remains sensibly at the same intensity of light (not far from the maximum of the present appearance) during this period. On October 26 it will be within 20′ from 1 Piscium (B.A.C. 7985), and on November 3 very close to 3 Piscium (B.A.C. 8012), stars of the sixth magnitude.

HARTWIG'S COMET.—The subjoined places of this comet are from the calculations of Dr. Oppenheim, and are also for Berlin midnight:—

	R.A.			N.P.D.		Log. distance from	
	h.	m.	s.	°	′	Earth.	Sun.
Oct. 22	17	52	1	76	23·8	0·0582	0·0610

3	18	23	26	80	15·1	0·1868	0·1370

COMETS 1880, *d* AND *e*.—M. Bigourdan has continued his ephemeris of the comet discovered by Schaberle on April 6, but states from observations made at Paris that the intensity of light has diminished much more rapidly than is due to change of distance from the earth and sun; on September 30 he estimated the comet to be of the same brightness as on May 18; it is still in a favourable position for observation, as will be seen from the following extract from M. Bigourdan's ephemeris for Paris midnight:—

	R.A. h. m. s.	N.P.D. ° ′		R.A. h m. s.	N.P.D. °
Oct. 22 ...	5 56 3 ...	89 49	Oct. 30 ...	5 34 22 ...	94 55
24 ...	– 50 57 ...	91 4	Nov. 1 ...	5 28 27 ...	96 12

28 ...	– 40 6 ...	93 [illegible]8	5 ...	5 16 6 ...	98 44

The Astronomer-Royal has notified the discovery of another comet by Mr. Lewis Swift of Rochester, N.Y., on the night of October 11, in R.A. 21h. 30m. and Decl. + 18°.

METEOROLOGICAL NOTES

PROF. LOOMIS, in his thirteenth contribution to meteorology, investigates the question of the great and sudden changes of temperature which are so marked a feature in the climates of a large portion of the United States. Six years' observations of the Signal Service stations have been examined, with the result that there are 118 stations at which there has occurred at least one case of a daily range not less than 40°·0. Limiting the inquiry, however, to stations at which the average number of cases amounted to six annually, it is seen that there are thirty-six such stations. The stations where the great fluctuations of temperature occur most frequently are situated south of lat. 35°, in which region the fluctuations of pressure attending the progress of storms are but little felt; and it is to be noted that these great fluctuations of temperature occur most frequently in the summer months. Thus at Wickenburg (lat. 34·0, long. 112°·7), which is situated in a desert sandy region, with an annual rainfall of only 4·99 inches, on ten of the nineteen days ending with August 14, 1877, the temperature showed a daily range of at least 62°·0, reaching in one case to 76°·0. These enormous temperature changes are due to the extreme dryness of the air, by which the sand becomes intensely heated by the sun during the day, whereas by night the loss of heat by radiation is as great as perhaps anywhere on the globe. The general result of the inquiry is that the most remarkable cases are merely examples of the ordinary diurnal change of temperature, unaffected by the passage of storms, whilst the remaining cases, which occur in the higher latitudes of the States, are to be ascribed to the influence of storms along with the ordinary diurnal change of temperature. It also appears from a careful investigation that dry air, even when greatly heated, has but little ascensional force, and that the violent uprising of heated air, so frequently witnessed in moist climates, particularly during thunderstorms, is mainly due to the large amount of aqueous vapour with which it is charged. As regards great fluctuations of temperature in winter, Prof. Loomis points out that while, for example, a temperature of – 20°·0 occurs at Denver on the east side of the Rocky Mountains, an average temperature of 30°·0 prevails in the Salt Lake Basin, and remarks that by the movements of the atmosphere attending the progress of a great storm these contiguous masses of air with temperatures so different from each other are brought successively over the same station, and thus bring about a change of temperature amounting on occasions to 50°·0 in a single hour.

PROF. LOOMIS also carefully investigates the storms, with their characteristic low barometers, which cross the Rocky Mountains, and shows that no great barometric disturbances originate in the Salt Lake Basin; that nearly all the great barometric disturbances experienced in the Salt Lake Basin come from the Pacific, and generally from the north-west; and that nearly all these disturbances can be followed to the Atlantic, meeting it near lat. 47°·0, and occupying from two to six days in the passage, or an average of three and a half days, corresponding to an onward movement of about 700 English miles a day. As has been shown to obtain in other regions of the globe, the isobars which define storms are often not so symmetrical over a mountainous region as over a level country. In not a few cases however the isobars show considerable symmetry over the Rocky Mountains, and this feature becomes the more noticeable in very violent storms. From the observations made at Pike's Peak, 14,200 feet high, as well as at Mount Washington, 6,285 feet, it appears that the winds at great elevations circulate about a low barometer, just as they do near the level of the sea; but the position of this centre at great heights sometimes differs considerably from the low centre prevailing at the surface of the earth, and when such deviation does occur it is generally toward the north-west. Of the thirty-six cases examined, the low centre at great elevation was, in twenty-seven cases, vertical over the low centre at lower levels, in five cases to north-west, in one case to north, in another case to west, and in two cases to east. It must however not be lost sight of that this important point in the phenomena of storms cannot be exactly determined but by a multiplication of high-level stations.

DISPLAYS of auroras appear to have been remarkably frequent in America during August last. In Mr. Carpmael's Weather Report of the month for Canada it is stated that the aurora of the 12th was very brilliant, and was seen at nearly every station from Manitoba to the Atlantic. From the United States Monthly Weather Report we learn that auroras were frequent during the month, occurring on no fewer than twenty-one nights, the auroras of the 12th and 13th being of remarkable brilliancy, as well as widespread. On these nights the aurora was seen at about 100 stations from Maine westward, as far as clear skies allowed its being seen. The more prominent features of these auroras as detailed in the Report are of such interest as to suggest that a more detailed account of them, as seen in the northern hemisphere during the night of August 12 and 13, could not fail to contribute data of the greatest importance in this little-understood branch of physics.

IN the *Journal* of the Scottish Meteorological Society, recently published, there is a paper of some interest, by Mr. Buchan, on the diurnal periods of thunderstorms in Scotland. There are two well-marked types of thunderstorms, the one occurring in the summer months, and having its daily maximum frequency from 1 p.m. to 6 p.m., and the other occurring in the winter months, with its maximum from 9 p.m. to 3 a.m. Stations in the eastern division of the country where the annual rainfall is small, or only of moderate amount, have all, or nearly all, their thunderstorms during the summer months; whereas in the west, or where the climate is wet and the rainfall heavy, a very considerable proportion of the thunderstorms occur during the winter months, and these are nearly always of short duration, and are the accompaniments of the winter cyclones of North-Western Europe. In this connection it is interesting to note that the thunderstorms of Stykhisholm in Iceland are phenomena of the winter months and of the nights, only three being recorded as having happened at a time of the day when the sun was above the horizon. The maximum daily period of the summer thunderstorm coincides with the hours when the ascending columns of heated air from the earth's surface are in full activity, and the result is no doubt largely due to the circumstance that these ascending masses of heated air develop a charge of electricity as their moisture condenses into cloud. The period of maximum frequency of the winter thunderstorm occurs some hours before and after midnight, or during those hours of the day when the land surface presented to the vapour-laden winds of the Atlantic approaches to and reaches its diurnal minimum temperature, and when consequently the condensation of the vapour may be expected to reach its daily maximum. On the other hand, the minimum period in summer occurs during the early morning, the absolute minimum being at the hour just before the ascending columns of heated air are set in motion, and the number remains few till about 11 a.m., or till the tops of the heated columns have risen to some height in the atmospheres.

IN the *Journal* of the Meteorological Society for April and July last are given the results of observations made during the first six months of 1880 at about forty "climatological stations" recently established by the society. At these stations observations are taken only once a day, *viz.*, at 9 a.m., and are restricted to temperature, cloud, and rain. An extension of these stations which would include the whole of the English sanataria, and which doubtless will gradually be effected, would furnish data for a correct presentation of the comparative climatologies of the health resorts of England.

BIOLOGICAL NOTES

NEST-BUILDING AMPHIPODS.—Mr. S. J. Smith, in a memoir on some amphipods described by Thomas Say (*Trans.*, Connecticut Acad., July, 1880), states that the tubes which certain species make to live in are to a great extent formed of pellets of their excreta. In 1874 he watched carefully the process of constructing the tubes in several species of Amphipoda. *Microdeutopus grandimanus* (*M. minax*, Smith) was a particularly favourable subject for observation. When captured and placed in a small zoophyte trough with small branching algæ, the individuals almost always proceeded at once to construct a tube, and could very readily be observed under the microscope. A few slender branches of the alga were pulled toward each other by means of the antennæ and gnathopods, and fastened by threads of cement spun from branch to branch by the first and second pairs of peræopods. The branches were not usually at once brought near enough together to serve as the framework of the tube, but were gradually brought together by pulling them in and fastening them a little at a time, until they were brought into the proper position, where they were firmly held by means of a thick network of fine threads of cement spun from branch to branch. After the tube had assumed very nearly its completed form, it was still usually nothing but a transparent network of cement threads woven among the branches of the alga, though occasionally a branch of the alga was bitten off and added to the framework: but very soon the animal began to work bits of excrement and bits of alga into the net. In this case the pellets of excrement, as passed, were taken in the gnathopods and maxillipeds, and apparently also by the maxillæ and mandibles, and broken into minute fragments and worked through the web, upon the outside of which they seemed to adhere, partially by the viscosity of the cement threads, and partially by the tangle of threads over them. Excrement and bits of alga were thus worked into the wall of the tube until the whole animal was protected from view, while, during the whole process, the spinning of cement over the inside of the tube was kept up. When spinning the cement threads within the tube the animal was held in place on the ventral side by the second pair of gnathopods and the caudal appendages, the latter being curved beneath the anterior portion of the pleon, and on the dorsal side by the third, fourth, and fifth pairs of peræopods extended and turned up over the back, with the dactyli turned outward into the web. The spinning was done wholly with the first and second peræopods, the tips of which were touched from point to point over the inside of the skeleton tube in a way that recalled strongly the movements of the hands in playing upon a piano. The cement adhered at once at the points touched and spun out between them in uniform delicate threads. The threads seemed to harden very quickly after they were spun, and did not seem even from the first to adhere to the animal itself.

DEATH BY HANGING.—Recent experiments regarding the nature of death by hanging or strangulation induce Prof. Tammasia to reject the view that the chief cause of such death is compression of the pneumogastric, causing paralysis of the heart (*Reale Ist. Lomb.*, fasc. xiii.). In the great majority of cases, he says, the proximate cause of death is the occlusion of the respiratory passages. The greater or lesser rapidity of the death depends on the degree of such occlusion. Compression of the pneumogastric and of the vessels of the neck may strengthen the efficacy of that direct cause, but, in the absence of the latter, it is insufficient to cause any instantaneous lethal phenomenon, as some have supposed.

HÆMOGLOBIN IN ECHINODERMS.—The presence of hæmoglobin in the aquiferous system of an Echinoderm (*Ophiactis virens*, one of the Ophiurida) has lately been demonstrated by M. Foettinger (Belgian Acad. *Bull.*, No. 5). The only branches of the metazoa in which it had not before been found were echinoderms and zoophytes. Simroth observed certain globules in the ambulacral canals of the former, but not observing live individuals, he missed the hæmoglobin, which may be observed if one of the arms of the living animal be broken; a drop of red colour appearing presently at the extremity. With the spectroscope the identity of the colouring matter with that of the blood of vertebrates can be easily proved. The hæmoglobin is connected with globules, of varying form and size. Most have a nucleus and are true cells. Along with these are free nuclei and small unnucleated corpuscles charged with hæmoglobin.

AN OPTICAL PROPERTY OF THE CORNEA.—Prof. Fleischl of Vienna has recently examined fresh corneas in polarised light, and found that the corneal fibres became, under tension, doubly refractive, and then occasionally give phenomena similar to those occurring in starch granules (the theory of which has been examined by von Lang). With this condition also is connected the opacity of the cornea on rise of intraocular pressure.

PHOSPHORIC ACID IN THE URINE OF COWS.—It is generally supposed that the urine of herbivora does not contain phosphoric acid. M. Chevron, however, lately had occasion (*Bull. de l'Acad. Roy. de Belg.*, No. 8) to observe phosphates (a combination of potassico-magnesian phosphate with bimagnesic phosphate) in the urine of cows which had been receiving linseed oil-cake (1½ kil. per head daily), bran (1½ kil.), beet (25 kil.), and straw (7½ kil.), a diet which is rich in phosphoric acid (oil-cake and bran) and in potash (beet). The phosphoric acid diminished and disappeared when green clover or lucern was substituted for the beet. It appears from experiments made by Herr Bertram in Leipzig, in 1878, that lime has the property of eliminating phosphoric acid from the urine of herbivora, and M. Chevron points out that the green fodder specified undoubtedly imparted more lime than the beet did. He proposes further experiment, however, to determine exactly the cause of elimination of the acid.

RUDIMENTARY COMA IN GODETIA.—While investigating the development of the embryo sac in the different genera of Onagraceæ, writes Mr. John M. Coulter, editor of the *Botanical Gazette*, Indiana (vol. v. Nos. 8 and 9, p. 75), my attention was attracted to certain hair-like projections which appeared upon the forming ovule of Godetia (probably *G. grandiflora*). A careful examination showed them to be identical in structure with the forming hairs in the coma of Epilobium. They occurred almost exclusively at the chalazal end, one or two scattered ones being detected farther down upon the raphe. A study of the development of the coma of Epilobium shows that the first indication of it is a tuberculated appearance of the chalazal end. Presently these tubercles push out into elongating nucleated cells, which eventually develop into the long hairs of the coma. Now Godetia permanently retains this tuberculated margin at the upper end, but does not usually develop its coma any further. In the cases examined, however, the forming ovules (either in reminiscence or prophecy) stretched out their tubercles into incipient hairs. Tracing these ovules in their subsequent development, it was found that these hairs gradually disappeared until, when the ovules had become anatropous, there was no indication of them. As Godetia has been merged into Œnothera, many species of the latter were examined, to see if any such thing occurred in them; but no trace of such growth was detected. This would seem to indicate that if Godetia be not entitled to generic rank, it is at least that part of Œnothera which approaches Epilobium. A discrepancy must, however, be noticed here. In Epilobium the hairs of the coma do not begin to form until the ovule has become completely anatropous; but in the Godetia observed the incipient coma had all disappeared by the time the ovule had become anatropous, beginning to form before the nucleus is half covered by the coats. These hairs appeared in greatest size and abundance when the axis of the ovule was at right angles to its anatropous position.

PHYSICAL NOTES

A BEAUTIFUL illustration of the laws of polarisation of light has lately been made by M. G. Govi. To understand it requires a somewhat careful explanation. Let a parallel beam of light be passed through a polariser, then through a thin slice of quartz cut perpendicularly to the optic axis, then through an analysing Nicol prism. It is seen, as is well known, to be coloured. This coloured light when passed into a spectroscope gives a spectrum marked by one or more dark bands, corresponding to the particular rays whose relative retardations in passing through the crystal slice have produced interference. These bands are not always in one place; they are displaced right (or left (according to whether the crystal is a right-handed or a left-handed specimen) if either the analyser or the polariser be rotated. A slice of quartz about 4·3 millims. thick produces a single band. One of 8·6 millims. two bands at once in the visible spectrum, the number of bands being proportional to the thickness of the crystal. Now suppose a mechanical contrivance by which both the analyser and the spectrum can be rotated at the same velocity. A direct-vision prism attached to the front of the Nicol prism realises the optical portion of this combination. There will be seen on rotation a circular spectrum, having either red or violet at the centre and either violet or red at its outer circumference. Now since the dark band spoken of is displaced by a quantity proportional to the amount of rotation, interference will take place in this circular spectrum along points which form geometrically a spiral of Archimedes. The persistence of impressions on the retina will enable this dark spiral to be seen in its entirety, provided the rotation be sufficiently rapid. If a thicker piece of quartz be used, giving two, three, or four dark bands, the rotation-spectrum will present a most beautiful appearance, being crossed by a two-branched, or three-branched, or four-branched spiral, the separate lines of which proceed from the centre to the circumference. The sense of these dark spirals will change with the sense of the impressed rotation. The effects are very striking.

SEVERAL ingenious contemporaries of ours on this side of the Atlantic have furnished the eager appetites of their readers with diagrams of Graham Bell's photophone, of which the most casual observer cannot fail to notice the utter want of resemblance to one another. More than one at least of these is *ben trovato*.

LIQUID OZONE has been obtained by MM. P. Hautefeuille and J. Chappuis, and is found to be of a beautiful blue colour. If a mixture of oxygen and ozone at a temperature of about − 23° or − 25° be subjected to a considerable pressure, the ozone liquefies and will remain liquid even though the pressure be reduced to 10 atmospheres. Experiments involving alterations of pressure must however be carefully made; for the ozone is liable to change into oxygen with a sudden evolution of heat, producing an increase of pressure with explosive violence. It is necessary to interpose a layer of sulphuric acid upon the top of the column of mercury by which the pressure is applied in the instrument, as ozone acts directly on the mercury.

HERR HANKEL has recently (*Wied. Ann.*, No. 8) endeavoured to prove the direct transformation of vibrations of radiant heat into electricity. He had formerly shown that rock crystal has thermoelectric polar axes in the direction of its secondary axes (the six successive poles being alternately positive and negative), and he supposes the ether within the crystal to be so arranged that under influence and with participation of the material molecules it is movable in circular paths round the secondary axes, and more easily movable in one direction than in the other. Thus all along a secondary axis the more easily occurring rotation has the same direction, but looked at from without, the direction is opposite at one end to what it is at the other, so giving the opposite modifications of electricity. When radiations from without strike along such an axis, those vibrations in them whose direction coincides with that of the easier rotation of the ether-molecule in the crystal should induce rotation of this along with the material molecule, and at the two ends of the secondary axis there should be electric tensions, with opposite electricity. Herr Hankel verified this by placing an insulated metallic ball connected with a gold-leaf electroscope in the middle of one edge of a rock crystal fixed with its principal axis vertical, while sunlight was thrown from the other side along the secondary axis terminating at the ball; then the arrangement was reversed. The electroscope indicated opposite electricities in the two cases. A gas-flame or a heated ball gave similar effects, which, moreover, were proved to be due to the dark heat rays (not to the luminous rays).

THE specific rotatory power of paraglobulin in blood serum is 47°·8 for yellow light; that of albumen, 57°·3. As these are the only albuminoid substances present in any considerable quantity, two determinations with the aid of the polaristrobometer suffice (as M. Fredericq has shown to the Belgian Academy) for ascertaining their relative proportions. The rotation produced by the whole liquid is first determined; then the paraglobulin is precipitated with $MgSO_4$, then redissolved in a volume of water equal to that of the original serum, and the rotation-number got from this is deducted from that got previously. Each of the numbers divided by that representing the specific rotatory power of the corresponding substance indicates the quantity of the substance in 100 cc.

IN a recent brief memoir to the *R. Accademia dei Lincei* (*Atti*, June, 1880), Dr. Bartoli describes an ingenious application of the Bunsen calorimeter to determination of the mechanical equivalent of heat. A given mass of mercury at zero temperature is subjected to a considerable pressure, exactly determined, and passed through a steel tube of so small internal diameter and such length that its velocity of outflow is virtually *nil*, and so the work equivalent to the kinetic energy of the mercury issuing from the tube becomes negligible in presence of the work consumed by friction between the mercury and the walls of the tube. This tube penetrates into a metallic cylinder situated within the reservoir of the Bunsen calorimeter. The quantity of ice melted in the calorimeter serves as measure of the heat developed by the work of efflux of mercury. It is stated that the numerical results are noteworthy for their agreement with the mean of former determinations, and still more for the narrow limits between which the extreme values arrived at are comprised.

EXPERIMENTS with regard to interpretation of the unequal reversal of magnesium lines in the green part of the solar spectrum are detailed by M. Fiévez in a recent paper to the Belgian Academy (*Bull.* No. 8). He first examined the influence of relative intensity of bright magnesium lines on their visibility by observing them separately and projecting them on the solar spectrum. Then he repeated the experiments of simplification of the spectrum by varying the intensity of the spark. Lastly, he studied the influence of greater or less dispersion and definition on the number and visibility of the lines, comparing prismatic with diffraction spectra. The experimental arrangements were mainly the same as in his recent researches on the spectra of hydrogen and nitrogen. The conclusion he arrives at is that the unequal reversal in question is due merely to a difference in the intensity of the bright lines, not to a dissociation of the metal.

M. BOUTY considers he has proved (*Journal de Phys.*, September) that in simple electrolysis the Peltier phenomenon is produced according to the same laws as at the surface of contact of two metals. It is a purely physical phenomenon without known relations with the heat of combination, or with the latent heat of solution, but connected by a precise law with the thermoelectric forces of corresponding couples. Chemical actions intervene in the production of one or other of the two inverse phenomena merely as disturbing causes, either altering the nature of the surfaces or producing a secondary liberation of heat. They may mask, more or less, the phenomenon on which they are superposed, but they do not produce it.

GEOGRAPHICAL NOTES

MR. LEIGH SMITH, during his Arctic cruise in his yacht *Eira*, has evidently done some very good work this summer. After cruising about the east coast of Greenland and in the neighbourhood of Spitzbergen, finding the ice-pack too dense and too far south to get far north without danger—although he reached 79° 40′ N. in 46° 50′ E., the farthest point yet reached in that direction—Franz-Josef Land was reached on August 14. Here much exploring work was done. Land was found stretching away west and north-west from that discovered by the Austrians. A fine harbour, called after the *Eira*, was found in 80° 5′ 25″ N., 48° 50′ E., and several excursions were made from this basis, among the numerous fjords that pierce the mainland north and north-west. From the point named by the last Dutch expedition Barentz Hook, land was traced westwards some 110 miles, and from the extreme north-west point reached land was sighted forty miles further north-west. In the sea between were several large and small islands, all covered with glaciers and snow-fields, with bluff black headlands on the southern exposure, covered with vegetation. Several Arctic flowers were collected and brought home; a number of soundings and dredgings were made, yielding interesting results, and two bears which were caught have been sent to the Zoological Gardens. Evidently there is here a considerable archipelago, if not continuous stretch of land, giving some support to Petermann's theory that the Pole is probably surrounded by numerous islands. It is stated that Mr. Leigh Smith goes back next year; we trust he will reach Eira Harbour early, and be able to still further extend our knowledge of these new Arctic lands.

THE October number of *Petermann's Mittheilungen* contains several good papers. There is an interesting account of the progress of the Japanese trading station in Corea, which now contains about 2,000 Japanese inhabitants. Important information is given as to the results of Dr. O. Finsch's voyage in the Pacific. During a stay in the Sandwich Islands he made considerable additions to our knowledge of their natural history; thence he went to Jabut (Bonham) in the south of the Marshall Group, where his collections and observations in all directions were numerous and of great value. Thence he proceeded to the Gilbert or Kingsmill Group, and afterwards to the Carolines. Some idea of the results so far may be obtained from the fact that he has sent to Europe something like thirty boxes of collections; the materials collected in ten months embrace 70 mammals, 180 birds, 800 reptiles, 1,200 fishes, 15,000 molluscs, 800 crustaceans, 400 spiders, 1,400 insects, and about 150 other animals, besides 700 plants, and two boxes of minerals. In anthropology there are 50 skulls and 55 casts of faces, representing the peoples of 20 different islands, besides 1,500 ethnographical objects. Dr. Hann contributes "Some Results of Recent Meteorological and Hypsometric Observations in Equatorial East Africa;" Col. Mason-Bey, a detailed account of Darfur; and Prof. Ratzel, a paper on the Formation of Fjords in Inland Seas.

UNDER the title of "Some Heroes of Travel," the Society for Promoting Christian Knowledge has issued a volume by that versatile and successful compiler Mr. Davenport Adams. It contains the stories of Marco Polo, G. F. Ruxton (Mexico and the Rocky Mountains), Barth, T. W. Atkinson (Siberia and Central Asia), Miss Tinné, Mr. McGahan, Col. Warburton, (Australia), Major Burnaby, and Sir Samuel Baker. Mr. Adams seems to have done his work conscientiously, and the book is likely to interest youthful readers and those fond of tales of adventure.

VOL. v. of Dr. Robert Brown's "Countries of the World" (Cassell) includes Siberia, the Chinese Empire, Burmah, and the other countries of the Indo-Chinese peninsula, India and neighbouring countries, Central Asiatic States, Russian Central Asia, and Persia. The new volume is quite up to the mark of the previous ones, and the numerous illustrations are well selected.

M. E. S. ZEBALLOS, writing from Buenos Ayres to *L'Exploration*, states that he has returned from the exploration of the Pampas of the Argentine Republic, and instead of finding them the featureless dead level which they are usually described, he discovered majestic mountains, lakes, rivers, and other features, which will materially change the map of South America. M. Zeballos kept minute records of his expedition, topographical, descriptive, scientific, meteorological, &c., which we hope will be placed within the reach of European geographers.

IN the last number of the *Bulletin* of the Eastern Siberian (Irkutsk) Section of the Russian Geographical Society is the continuation of the Report of M. Tcherski of the results of his three years geological exploration of the neighbourhood of Lake Baikal.

THE fourth Belgian expedition, under Capt. Raemackers, had got well into Central Africa from Bagamoyo by the end of August.

THE FIRST DECADE OF THE UNITED STATES FISH COMMISSION—ITS PLAN OF WORK AND ACCOMPLISHED RESULTS, SCIENTIFIC AND ECONOMICAL[1]

THERE are now no less than nine departments of the Government devoted, in part or wholly, to researches in pure and applied science—the Geological Survey, the Coast and Geodetic Survey, the Naval Observatory, the National Museum, the Department of Agriculture, the Entomological Commission, the Tenth Census, with its special agencies for the study of the natural resources of the country, the Smithsonian Bureau of Ethnology, and the Commission of Fish and Fisheries. The Smithsonian Institution, established upon an independent foundation, should also be mentioned, as well as the Medical Museum of the Army and the various laboratories under the control of the Army and Navy Departments.

The Geological Survey is not now carrying on any of the schemes of zoological and botanical investigation engaged in by its predecessors.

The work of the Entomological Commission and that of the Census, though of extreme importance, are limited in scope and duration, while that of the Agricultural Department is necessarily, for the most part, economical.

The work of the National Museum is chiefly confined to the study of collections made by Government Surveys, or individual collectors, as sent in to be reported upon.

The work of the Fish Commission, in one of its aspects, may perhaps be regarded as the most prominent of the present efforts of the Government in aid of aggressive biological research.

On the 9th of February, 1871, Congress passed a joint resolution which authorised the appointment of a Commissioner of Fish and Fisheries. Prof. Baird, at that time Assistant-Secretary of the Smithsonian Institution, was appointed, and entered at once upon his duties.

The summer of 1880 marks the tenth season of active work since its inception in 1871. The Fish Commission now fills a place tenfold more extensive and useful than at first. The present essay aims to show, in a general way, what it has done, is doing, and expects to do—its purposes, its methods, its results.

The work is naturally divided into three sections—

1. The systematic investigation of the waters of the United States and of the biological and physical problems which they present.—In making his original plans the Commissioner insisted that to study only the food-fishes would be of little importance, and that useful conclusions must needs rest upon a broad foundation of investigations purely scientific in character. The life-history of species of economic value should be understood from beginning to end, but no less requisite is it to know the histories of the animals and plants upon which they feed, or upon which their food is nourished; the histories of their enemies and friends, and the friends and foes of their enemies and friends, as well as the currents, temperatures, and other physical phenomena of the waters in their relation to migration, reproduction, and growth. A necessary accompaniment to this *division* is the amassing of material for research to be stored in the National and other Museums for future use.

2. The investigation of the methods of the fisheries of the past and present, and the statistics of production and commerce in fishery products.—Man being one of the chief destroyers of fish, *his* influence upon their abundance must be studied. Fishery methods and apparatus must be examined and compared with those of other lands, that the use of those which threaten the destruction of useful fishes may be discouraged, and that those which are inefficient may be replaced by others more serviceable. Statistics of industry and trade must be secured for the use of Congress in making treaties or imposing tariffs, to show to producers the best markets, and to consumers where and with what their needs may be supplied.

3. The introduction and multiplication of useful food-fishes throughout the country, especially in waters under the jurisdiction of the general Government, or those common to several States, none of which might feel willing to make expenditures for the benefit of the others.

Although activity in this direction may be regarded in the light of applied rather than pure scientific work, it is particularly important to the biologist, since it affords opportunities for investigating many new problems in physiology and embryology.

Since the important fisheries centre in New England the coast of this district has been the seat of the most active operations in marine research. For ten years the Commissioner, with a party of specialists, has devoted the summer season to work at the shore at various stations along the coast from Connecticut to Nova Scotia. A suitable place having been selected, a temporary laboratory is fitted up with the necessary appliances for collecting and study. In this are placed from ten to twenty tables, each occupied by an investigator, either an officer of the Commission or a volunteer. From 1873 to 1879 important aid was rendered by the Secretary of the Navy, who detailed for this service a steamer to be used in dredging and trawling, and this year the steamer built expressly for the Commission is employed in the same manner.[1]

The regular routine of operations at a summer station includes all the various forms of activity known to naturalists: collecting along the shore, seining upon the beaches, setting traps for animals not otherwise to be obtained, and scraping with dredge and trawl the bottom of the sea at depths as great as can be reached by a steamer in a trip of three days. In the laboratory are carried on the usual structural and systematic studies, the preparation of museum specimens and of reports. Since the organisation of the Commission the deep-sea work and the investigation of invertebrate animals has been under the charge of Prof. Verrill, who had for many years before the Commission was established been studying independently the invertebrate fauna of New England.

In addition to what has been done at the summer station, more or less exhaustive investigations have been carried on by smaller parties on many parts of the coast and in interior waters.

---

[1] Read before the American Association for the Advancement of Science, Boston, August 28, 1880, by G. Brown Goode.

[1] The number of dredging and trawling stations on record is as follows:--

1871.	Wood's Holl	345
1872.	Eastport. 200 by hand, 36 by steamer	236
1873.	Portland	149
1874.	Noank...	223
1875.	Wood's Holl	169
1877.	Salem	378
,,	Halifax	
1878.	Gloucester	
1879.	Provincetown	
		1,500

The number of seine hauls is about 600.

The fauna of the Grand Banks and other off-shore fishing-grounds has been partly explored. In 1872, 1873, and 1874 dredging was carried on from the Coast Survey steamer *Bache* by Prof. Packard and Mr. Cooke, Prof. Smith, Mr. Harger, and Mr. Rathbun. In 1879 Mr. H. L. Osborne spent three months in a cod-schooner collecting material on the Grand Banks, and Mr. N. P. Scudder as long a time on the Holibut Grounds of Davis's Straits.

A most remarkable series of contributions has been received from the fishermen of Cape Ann. When the Fish Commission had its head-quarters at Gloucester, in 1878, a general interest in the zoological work sprang up among the crews of the fishing-vessels, and since that time they have been vying with each other in efforts to find new animals. Their activity has been stimulated by the publication of lists of their donations in the local papers, and the number of separate lots of specimens received to the present time exceeds 800. Many of these lots are large, consisting of collecting-tanks full of alcoholic specimens. At least thirty fishing-vessels now carry collecting-tanks on every trip, and many of the fishermen, with characteristic superstition, have the idea that it insures good luck to have a tank on board, and will not go to sea without one. The number of specimens acquired in this manner is at least 50,000 or 60,000, most of them belonging to species otherwise unattainable. Each holibut vessel sets, twice daily, lines from ten to fourteen miles in length, with hooks upon them six feet apart, in water 1,200 to 1,800 feet in depth, and the quantity of living forms brought up in this manner, and which had never hitherto been saved, is very astonishing. Over thirty species of fishes have thus been added to the fauna of North America; and Prof. Verrill informs me that the number of new and extra-limital forms thus placed upon the list of invertebrates cannot be less than fifty.

A permanent collector, Mr. Vinal N. Edwards, has been employed at Wood's Holl and vicinity since 1871, and many remarkable forms have also been discovered by him. No dredging has yet been attempted by the Commission south of Long Island. Dr. Yarrow, Mr. Earll, and others, have collected from Cape May to Key West. The Gulf States Coast was explored last winter by a party conducted by Mr. Silas Stearns, who spent nine months in studying the food-fishes and useful invertebrates in behalf of the Commission and the Census. The entire Pacific coast has been scoured by Prof. Jordan for the Commission and the Census, and the ichthyology of that region has been enriched by the discovery of sixty species new to the fauna, forty of them being new to science. A similar investigation on the great lakes has been carried over a period of several years by the late Mr. Milner and Mr. Kumlien. The ichthyology of the rivers of the country has received much attention from the many experts employed by the Commission in fish-cultural work.

In addition to these local studies may be mentioned the general explorations such as are now being carried on for the oyster by Mr. Ernest Ingersoll and Mr. John F. Ryder, for the shad by Col. McDonald, for the smelt and the Atlantic salmon by Mr. C. G. Atkins, and the Quinnat salmon by Mr. Livingston Stone.

A partial indication of what has been accomplished may be found in the number of species added to the various faunal lists. Take, for instance, the cephalopod mollusks of New England, in Prof. Verril's recently published monographs; twenty species are mentioned, thirteen of which are new to science. Ten years ago only three were known.

I am indebted to Prof. Verrill for the following estimate of the number of species added within the past ten years to the fauna of New England, mainly by the agency of the Commission:—

	Formerly known.	Additions.	Now known.
Crustacea	105	193	298
Pycnogonida	5	10	15
Annelida	67	238	305
Vermes	39	100	139
Mollusca	317	109	426
Echinodermata	47	41	88
Anthozoa or Polyps	20	35	55
Hydrozoa or Acalepha	102	78	180
Tunicata	26	25	51
Polyzoa	56	91	147
Brachiopoda	5	0	5
Sponges	10	80	90
	800	1,000	1,800

It is but just to say that many of these species were obtained by Prof. Verril in the course of his independent explorations in Maine and Connecticut previous to 1871.

A similar estimate for the fishes indicates the discovery of at least 100 species on the Eastern Atlantic coast within ten years; half of these are new to science. Forty species have been added to the fauna north of Cape Cod; sixteen of these are new and have been found within three years. Seventeen have been described as new from the Gulf of Mexico. Sixty and more have been added upon the west coast. The results of the summer campaigns are worked in winter in the Peabody Museum of Yale College, under the direction of Prof. Verril, and by the specialists of the National Museum.

One of the important features of the work is the preparation of life-histories of the useful marine animals of the country, and great quantities of material have been accumulated relating to almost every species. A portion of this has been published. More or less complete biographical monographs have been printed on the bluefish, the scup, the menhaden, the salmon, and the whitefish, and others are nearly ready. Another monograph which may be referred to in this connection is that of Mr. Starbick on the whale-fishery, giving its history from the earliest settlement of North America.

The temperature of the water in its relation to the movements of fish has from the first received special attention. Observations are made regularly during the summer work, and at the various hatching-stations. At the instance of the commissioner, an extensive series of observations have, for several years, been made under the direction of the chief signal officer of the army, at lighthouses, light-ships, life-saving and signal stations, carefully chosen along the whole coast. This year thirty or more fishing schooners and steamers are carrying thermometers to record temperatures upon the fishing-grounds, a journal of the movements of the fish being kept at the same time. One practical result of the study of these observations has been the demonstration of the cause of the failure of the Menhaden fisheries on the coast of Maine in 1879—a failure on account of which nearly 2,000 persons were thrown out of employment. Another important series of investigations carried on by Commander Beardsley of the Navy shows the error of the ordinary manner of using the Casel-Miller deep-sea thermometer; still another series made by Dr. Kidder of the Navy, and to be carried out in future, had for its object the determination of the temperature of the blood of marine animals. Observations have also been made by Mr. Milner upon the influence of a change from sea water into fresh water, and from fresh water into sea water upon the young of different fishes. Mr. H. J. Rice carried on a series of studies upon the effect of cold in retarding the development of incubating fish-eggs. A series of analyses have been made by Prof. Atwater to determine the chemical composition and nutritive value of fish as compared with other articles of food. This investigation is still in progress. In connection with the work of fish-culture, much attention has been paid to embryology. The breeding times and habits of nearly all of our fishes have been studied and their relations to water temperatures. The embryological history of a number of species such as the cod, shad, alewife, salmon, smelt, Spanish mackerel, striped bass, white perch, and the oyster, have been obtained, under the auspices of the Commission, by Messrs. Brooks, Ryder, Schaeffer, Rice, and others.

The introduction of new species in water in which they were previously unknown is of special interest to the student of geographical distribution. Through the agency of the Commission the German carp has already been placed in nearly every State and Territory, although the work of distribution has only just begun, and the tench (*Tinca vulgaris*) and the golden orfe (*Idus melanotus*) have been acclimated; the shad has been successfully planted in the Mississippi valley and on the coast of California, and the California salmon in the rivers of the Atlantic slope. The lake whitefish of Europe has been introduced into a lake of Wisconsin. As an act of international courtesy, California salmon have been successfully introduced into New Zealand and Germany. The propagation work has increased in importance from year to year, as may be seen by the constant increase in the amount of the annual appropriation. A review of the results of the labours of the Commission in increasing the food supply of the country may be found in the annual reports. The rude appliances of fish culture in use ten years ago have given way to scientifically devised apparatus, by which millions of eggs are hatched where only thousands were before, and the demonstration of the possibility of stocking rivers and lakes to any desired extent has been greatly strengthened. This work was for six years most efficiently directed by the late Mr. James W. Milner, and is now in charge of Major T. B. Ferguson, also Commissioner for the State of Maryland, by whom has been devised the machinery for propagation on a gigantic scale, by the aid of steam, which is now so successfully in use.

The investigation of the statistics and history of the fisheries has perhaps assumed greater proportions than was at first contemplated. One of the immediate causes of the establishment of the Commission was the dissension between the line and net-fishermen of southern New England with reference to laws for the protection of the deteriorating fisheries of that region. The first work of Prof. Baird as Commissioner was to investigate the causes of this deterioration, and the report of that year's work includes much statistical material. In the same year a zoological and statistical survey of the great lakes was accomplished, and various circulars were sent out in contemplation of the preparation of monographic reports upon the special branches of the fisheries, some of which have already been published.

Some thirty trained experts are now engaged in the preparation of a statistical report on the present state and the past history of the fisheries of the United States. This will be finished next year, but the subject will hereafter be continued in monographs upon separate branches of the fisheries, such as the holibut fishery, the mackerel fishery, the shad fishery, the cod fishery, the herring fishery, the smelt fishery, and various others of less importance.

Hundreds, and even thousands of specimens of a single species are often obtained. After those for the National Museum have been selected, a great number of duplicates remain. These are identified, labelled, and made up into sets for exchange with other museums and for distribution to schools and small museums. This is in accordance with the time-honoured usage of the Smithsonian Institution, and is regarded as an important branch of the work. Several specialists are employed solely in making up these sets and in gathering material required for their completion. Within three years fifty sets of fishes in alcohol, including at least ten thousand specimens, have been sent out, and fifty sets of invertebrates, embracing 175 species and 25,000 specimens. One hundred smaller sets of representative forms intended for educational purposes, to be given to schools and academies, are now being prepared. The arrangement of the invertebrate duplicates is in the charge of Mr. Richard Rathbun; of the fishes, in that of Dr. T. H. Bean. Facilities have also been given to many institutions for making collections on their own behalf. Six annual reports have been published, with an aggregate of 5,650 pages. These cover the period 1871 to 1878. Many papers relating to the work have been published elsewhere, particularly descriptions of new species and results of special faunal exploration.

The season of 1880 was opened by the participation of the Commission in the International Exhibition at Berlin. The first honour-prize, the gift of the Emperor of Germany, was awarded to Prof. Baird, not alone as an acknowledgment that the display of the United States was the most perfect and most imposing, but as a personal tribute to one who, in the words of the president of the Deutscher Fisherei Verein, is regarded in Europe as the first fish-culturalist in the world.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

Oxford.—This year the term commences somewhat later than usual. The professorial lectures on natural science begin next week. At the University Museum Dr. Odling lectures on Typical Alcohols, Prof. Clifton on Experimental Electricity, Prof. Price on Hydro mechanics, Prof. Story-Maskelyne, M.P., on the Elements of Crystallography, Prof. Prestwich on Stratigraphical Geology, and Prof. Rolleston on Digestion.

Lectures are also given in the Chemical Department at the Museum by Mr. W. W. Fisher, on Inorganic Chemistry, by Mr. J. Watts on Organic Chemistry, and by Dr. F. D. Brown on Chemical Affinity. In the Biological Department Messrs. C. Robertson, W. H. Jackson, and A. P. Thomas form classes for instruction in Microscopy and Zoology. Mr. Barclay Thompson gives a course on the Comparative Anatomy of the Mammalia. In the Clarendon Laboratory Mr. Stocker lectures on Elementary Mechanics, and, with Mr. V. Jones, gives instruction in practical physics.

At the University Observatory Prof. Pritchard will lecture on Spherical Astronomy, including instruments, and will give a course of six lectures on the Precession of the Equinoxes, including the Lunar Physical Libration. The Observatory is opened on Monday and Tuesday evenings during the term to members of the University who desire to obtain instrumental practice. In his annual report to the Board of Visitors the Professor gives an account of the work carried on during the past year at the Observatory. The long series of observations in reference to the Inequalities in the Moon's Rotation are now finished, and the results will be shortly published. The calculations were brought to a successful issue during the Long Vacation, and afford a general confirmation of the investigations of Bouvard, Nicollet, and Wichmann, and establish the existence of small but sensible inequalities in the moon's rotation. Careful measurements have also been made by Mr. Plummer of the relative positions of forty stars in the Pleiades, and Mr. Jenkins has measured the relative co-ordinates of 250 stars in the cluster 39 Messier. Careful observations have also been made of the component stars of ξ Ursæ Majoris and 70 Ophiuchi. With regard to the instruments the Professor writes:—

"The large refractor has been thoroughly examined and cleaned by Mr. Grubb, the artist who constructed it. This at present is in an efficient working condition in every respect. From our own resources we have thoroughly overhauled the De La Rue Reflector, and it also is in excellent condition. It is fortunate for the University that both these instruments pass from time to time under the experienced and critical eye of Dr. De La Rue himself. For a time Dr. De La Rue's metallic speculum was replaced by an excellent silvered glass mirror, executed by Mr. With; the newer mirror possessed the greater capacity of the two, in point of brilliancy of reflected light, but was not deemed quite equal to Dr. De La Rue's in point of definition; we have therefore returned to the use of the original speculum.

"In order to carry out a new and important series of astronomical observations I soon found that the use of a chronograph was indispensable; accordingly I have, in conjunction with Mr. Grubb, devised a very inexpensive but practically efficient form of that instrument. The total cost of this instrument, together with a corresponding and necessary addition to the mechanism of the sidereal clock, has not exceeded 10*l*. I am told on the best authority that this form of the chronograph will henceforth prove a desirable adjunct in other observatories.

"With the view of bringing practical astronomy within the reach of a moderate expenditure I have (again in conjunction with Mr. Grubb) devised a modification of existing small equatorial telescopes, which I anticipate will prove a boon to beginners in astronomical science.

"Lastly, I have devised and carried into execution a simple form of precessional globe for the use of students in astronomy. It affords very ready means of representing the risings and settings of the stars, and the general aspect of the heavens at the remotest periods of time, past and future, and as seen at any locality."

In the Botanic Garden Prof. Lawson will give instruction on the Minute Anatomy of the Vegetable Tissues.

The following lectures are given in those colleges which possess laboratories. At Christ Church Mr. Vernon Harcourt lectures on the Non-metallic Elements, and Mr. R. E. Baynes on Dynamical Electricity and Conduction of Heat. At Balliol College Mr. J. W. Russell lectures on Problems in Mechanics, and Mr. H. B. Dixon on Elementary Heat and Light. At Exeter College Mr. Lewis Morgan lectures on Practical Histology, and at Magdalen College Mr. C. J. Yule gives a course of demonstrations on the Chemical Composition of the Body.

An examination for Natural Science Scholarships is being held by Trinity and Exeter Colleges. The former College has this year for the first time offered a scholarship for proficiency in science. At Merton College the science scholarship (Postmastership) was not awarded.

At Balliol College there will be offered next month a science scholarship, on the foundation of Miss Brakenbury, open to all candidates without limitation of age, who shall not have exceeded eight terms from matriculation. The scholarship is of the annual value of 80*l*., and is tenable for four years during residence. Papers will be set in the following subjects:—(1) Mechanical Philosophy and Physics, (2) Chemistry, (3) Physiology. Candidates will not be expected to offer themselves in more than two of these. There will be a practical examination in one or more of the above subjects if the examiners think it expedient. Intending candidates should communicate with the Master of Balliol before November 12. There will also be offered two exhibitions worth 40*l.* a year, the examination for which will comprise the elements of Physics, Chemistry, or Physiology, as well as Classics and Mathematics.

CAMBRIDGE.—Dr. Michael Foster will lecture on elementary physiology; Mr. Langley will lecture to the advanced class on general physiology twice a week; Mr. Lea takes physiological chemistry; and Dr. Gaskell the physiology of the circulation.

Mr. VENN will lecture during the next two terms on scientific method.

MR. FREEMAN of St. John's College is to lecture as deputy for Prof. Challis, owing to his infirm health.

DR. REGINALD THOMPSON of Trinity College is to be one of the Examiners for 3rd M.B., and Dr. Cheadle to be Assessor to the Regius Professor of Physic.

THE list of lecturers at Newnham College this term includes the names of Miss Crofts (English History and Literature), Miss Merrifield (Greek), Miss Harland (Algebra), and Miss Scott (Analytical Conics). The lectures are now delivered at the College, and not in Alexandra Hall.

AT St. Thomas's Hospital Medical School Mr. Robert Lawson has obtained the Entrance Scholarship in Natural Science, of the value of 100*l.*, and Mr. Herbert Lankester that of 60*l.*

AT the meeting of the Council of the College of Physical Science, Newcastle-on-Tyne, on October 11, it was decided without opposition that a lady candidate, Miss Isabel M. Aldis, should be allowed to hold an exhibition in the College. This decision completes the opening of the advantages of the College to lady students. They were previously admitted to all the lectures, but this is the first time that a lady has been a candidate for an exhibition.

SOCIETIES AND ACADEMIES

PARIS

Academy of Sciences, October 11.—M. Wurtz in the chair. The following papers were read:—On the *rôle* of time in the formation of salts, by M. Berthelot. Experiments with several hundred saline mixtures prove that the period of change in saline reactions, comprised between the moment when the system has become physically homogeneous and that when it attains its chemical equilibrium, is excessively short, and wholly included in the short duration of the calorimetric experiment. The same period in ethene reactions, on the other hand, is incomparably longer. The instantaneity in the former case is proved by an application of the author's theorem of slow actions.—On pellagra in Italy, by M. Faye. In the past year there have been 40,000 well-marked cases of the disease in Lombardy, and 30,000 in Venetia, the richest and most productive provinces in Italy. It is unknown in Naples, Sicily, and Sardinia (so poverty and bad hygiene do not seem to be the causes). Wherever pellagra appears in the endemic state *polenta* or *cruchade* are eaten, *i.e.*, varieties of unfermented bread (made from maize and millet), and M. Faye thinks the substitution of fermented bread would prove salutary.—On the photophonic experiments of Prof. Bell and Mr. Sumner Tainter, by M. Breguet.—On algebraic equations, by Mr. West.—Earthquakes at Smyrna on July 29, by Dr. Charpentin. The ravages and phenomena of this earthquake were limited to the Sipyle chain and the adjoining plains in a perimeter of only a few leagues; but the *contre-coup* was felt at great distances (Broussa, Rhodes, &c.). Chronometers at Athens were stopped. More than 3,000 years ago there seems to have been a volcano under Sipyle, and this point has been the centre of earthquakes in that region. The approximate coincidence (in time) of this last Smyrna earthquake with earthquakes at Manilla, the Azores, and Naples, is remarkable.—On the effects produced by cultivation of absinthe as insectifuge, and on its preventive application against phylloxera, by M. Poirot. Among the absinthe plants covering large tracts in North America the author has never seen flies, ants, worms, or any insects, nor yet scorpions, tarantulas, nor rattlesnakes. Land manured with absinthe might be fatal to the metamorphoses of phylloxera.—Ephemerides of comet *b* 1880 (continued), by M. Bigourdan.—Observations of comet *d* 1880 (discovered by Dr. Hartwig at Strassburg) at the Paris Observatory, by M. Bigourdan.—On the resolvent function of the equation $x^m + px + q = 0$, by M. Pujet.—On a property of Poisson's function, and on the integration of equations with partial derivatives of the first order, by M. Gilbert.—On a very extensive class of linear differential equations with rational coefficients, whose solution depends on the quadrature of an irrational algebraic product, by M. Dillner.—Principle of an algebraic calculus which contains as particular species the calculus of imaginary quantities and quaternions, by M. Lipschitz.—On the partition of numbers, by M. David.—On the mechanical actions of light, theoretical considerations capable of serving in interpretation of Prof. Bell's experiments, by M. Cros. In 1872 M. Cros presented a memoir to the Academy, in which, guided by theoretical considerations, he affirmed *à priori* the results of experiments which he thinks have a notable similarity to Prof. Bell's. In one experiment a ray of light interrupted n times a second was to be sent into a tube resonating with a note of n vibrations. The alternate rarefaction and condensation of the gaseous medium might make the tube speak.—Study of the distribution of light in the solar spectrum, by MM. Macé and Nicati. The maximum intensity is in the yellow, very near D. The perception of blue and violet diminishes much more slowly with diminished illumination than that of less refrangible colours. From the extreme red to green of about 0·5 μ wave-length, the law of distribution of intensity is the same whatever the illumination. Between eyes equally capable of discerning colour, there are very sensible differences.—Vibratory forms of circular pellicles of saposaccharic liquid, by M. Decharme. With a given diameter of pellicle the numbers of nodals are inversely proportional to the corresponding lengths of the vibrating rod (which produces the waves).—On the place which boron occupies in the series of simple bodies, by M. Etard. He places boron in the family of vanadium, very near that of phosphorus.—On propylacetal and isobutylacetal, by M. de Girard.

BALFOUR'S "COMPARATIVE EMBRYOLOGY"

A Treatise on Comparative Embryology. By Francis M. Balfour, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. In Two Volumes. Vol. I. (London: Macmillan and Co., 1880.)

IT is scarcely possible to exaggerate the expressions of gratitude which are due from zoologists to Mr. Balfour for the execution of the great task which some three or four years ago he set himself. Zoologists have to be thankful to him not only for the admirable style in which he has carried out his work, but for the promptitude with which he has achieved it. Mr. Balfour's object was to produce a work in which all that has been written during the last ten or fifteen years on the structural features exhibited by animals during their growth from the egg to the adult condition should be digested, and its import carefully estimated; the result being set forth in a systematic way, so that the broad conclusions arrived at by the almost innumerable studies of "development from the egg" in all sorts and conditions of animals should be pointedly placed before the reader. At the same time he aimed to provide for the purpose of reference and for the guidance of future students something like a complete bibliography, accompanied by an analysis in many cases, of the works which have been published on special forms.

It is very well known to those who are in a position to make a comparative estimate, that during the last fifteen years in no branch of science has there been such activity, such abundance of discovery, of careful observation and ingenious speculation, as in biology; and this activity has tended more and more to concentrate itself upon the study of the mode in which the complex adult organism (whether plant or animal), with all its astounding powers and its beauty of form—slowly, surely, and yet by most improbable and devious ways, advances to its complete estate from the condition of a microscopic structureless globule of albuminous slime. This marvel of development is one which has only recently come to man's knowledge, and it seems likely that the fascination which the study of it can exert will be such as to attract the energies of an ever-increasing crowd of observers.

Mr. Balfour's book gives for those who are to come a *résumé* or summing up of the labours of those who have up to this date worked for and created our knowledge of what this process of growth from the egg is and signifies.

The first volume deals with the history of development in all groups of animals excepting the Vertebrata. The labour which it has involved will be understood when it is stated that the author gives references to five hundred and seventy-two separate memoirs or books, most of which he has thoroughly read, and from many of which he gives extracts or carefully condensed abstracts.

The thoroughness with which the subject is presented to the student may be appreciated by a consideration of the fact that two hundred and seventy-five woodcuts are given in this volume, which are, with few exceptions, prepared especially for this work, either from the author's original drawings or from the drawings of the writers whom he is summarising.

The work is divided into an "Introduction" and a "Systematic Embryology." In the Introduction we have chapters on "The Ovum and the Spermatozoon," on "The Maturation and the Impregnation of the Ovum," and on "The Segmentation of the Ovum." The systematic portion is divided into chapters, each of which corresponds with one of the large divisions of animals, *e.g.* Porifera, Platyelminthes, Rotifera, Mollusca, Chætopoda, &c.

Mr. Balfour, it is hardly necessary to say, has not performed his task as an ordinary maker of books. He is, as all zoologists know, one of the foremost students of embryology in Europe, and has added a very large proportion himself to that great heap of isolated embryological memoirs and monographs which it is the purpose of his book to condense and render accessible to a wider circle of students. Consequently we find not only new and original observations scattered here and there in the chapters of this treatise, but on the very numerous matters which call for the expression of an opinion or the exercise of judgment between conflicting statements of preceding observers, we have the conclusions, always modestly formulated, of a thoroughly competent critic.

In fact those who are already advanced in the study of embryology will find that Mr. Balfour has freely and most legitimately made use of speculative views of his own, as a series of strings on which to thread the almost innumerable observed facts which have to be put on record and kept ready, as it were, for the future building up of embryological doctrine. The reader, on the other hand, who has not yet reached the degree of knowledge at which such speculations become intelligible, will find that there is so much in Mr. Balfour's pages of hard, solid, descriptive record of the actual developmental changes of one animal after another, that he will certainly not feel cause to complain.

It would be out of place to discuss in these pages any of the new theoretical considerations which Mr. Balfour puts forward. With some of them it is possible to find fault; at the same time they are all ingeniously supported and indicate close reasoning and a large survey of facts on the author's part. They serve, as Mr. Balfour himself recognises, to stimulate inquiry, and when advanced not by a paper-philosopher, but by a most exceptionally industrious observer, they cannot fail to command respect.

If we venture to offer any remark which suggests how possibly Mr. Balfour's book might have been even more excellent than it is, it must be clearly understood that as it stands we hold it to be a perfect mine of valuable information and well-considered suggestion. We should, however, have been glad had it been possible for the author to give more attention to the history of the various stages of progress in our knowledge of embryology in general, and of each particular group. Full justice is done to recent authors, and his own contemporaries receive ample recognition from Mr. Balfour; but the successive steps by which a particular point of view has been arrived at are not always definitely indicated and due merit assigned to each of those who in past times has laboured to bring about the present phase of science. This, no doubt, has not entered into Mr. Balfour's plan on account of the additional responsibility and labour which it would have involved, and the increase in size of what is already a voluminous treatise. But such treatment of the subject has a very high educational value and a certain ethical importance.

Further, it may be noted that the author has necessarily a difficulty to contend with in the scope itself of his book. Embryology is not a natural nor a convenient division of biological science. The study of the organism in its complete form cannot be advantageously separated from the study of the coming about of that form, and indeed it is very difficult for a writer who proposes to himself to describe the developmental changes of organisms to draw the line consistently in the various cases which he describes, and to say that at such a point his business with the organism ceases and that of the "antipædologist" begins. It is because the knowledge of embryological facts is to so large an extent new, that separate treatises on embryology are necessary. It is as a supplement to treatises on the structure or anatomy of animals which do not sufficiently deal with embryology that such a distinct treatise is needful, and such need is merely the result of the late development of embryological research.

In the course of time we shall no doubt see a complete fusion of "embryology" and "antipædology"—the facts of structure to be observed in the youth and in the maturity of organisms being treated as a matter of course concurrently. Nothing could conduce more directly to this desirable state of things than the really remarkable and successful effort which Mr. Balfour has made to gather together and present in a compact and logical form the embryological results which have been and still are pouring forth from Russian, German, English, French, and American laboratories in an overwhelming stream, calculated to daunt by its velocity any but the most determined student.

E. RAY LANKESTER

THE SIEVE-TUBES OF DICOTYLEDONOUS PLANTS

Beiträge zur Kenntniss des Siebrohrenapparates dicotyler Pflanzen. Von Dr. Karl Wilhelm. (Leipzig: W. Engelmann, 1880.)

IT is perhaps natural, owing to its peculiarities, and especially to the character of the cell walls, that the soft bast was comparatively lately investigated and described;[1] but it is surely a surprising fact that the ground should have been left open till the present year, for a thorough investigation of the development of those tissues which are characteristic of the phloem.

In the "Comparative Anatomy" of De Bary we find a full account of what was known in 1877 of the structure and development of the soft bast; at the same time the writer pointed out several questions concerning which further investigation was required. He drew especial attention to our want of knowledge of the relation of the cambiform cells[2] to the sieve-tubes, and of the development of the sieve plate, the callus mass, and the contents of the sieve-tube It has been the object of Dr. Wilhelm's researches to supply information on these several points; while at the same time he affords us many other interesting details.

Owing to the wideness of the subject it was impossible for the author to extend his researches beyond a limited number of types. Those selected were *Vitis vinifera*, L., *Curcubita pepo*, L., and *Lagenaria vulgaris*, Ser. It will be seen that Dr. Wilhelm has selected plants having sieve-tubes of the two different types common among the Dicotyledons, viz., Cucurbita and Lagenaria where the structure is more simple, Vitis where it is complicated by the presence of several sieve-plates side by side on the same cell wall. In a note at the end of the paper the author specially asserts that his results only apply to the plants named; while further research must show whether the structure described is really typical.

The main results arrived at are as follows:—Those formative cells of the bast which are set apart for the development of a member of a sieve-tube, usually suffer a longitudinal division into two unequal cells: the larger forms one member of the sieve-tube; the other, which is smaller and shorter, develops into the companion-cell (*Geleitzelle*). The latter may, in Cucurbita and Lagenaria, again divide. The walls separating the companion-cells from the sieve-tube are fitted, and the cell contents richly protoplasmic. It will be seen that these cells, being sister cells of the members of the sieve-tubes, must be distinguished from the larger cells, which are usually termed "cambiform;" these latter being formed by division from formative cells of the bast, but not being in direct genetic connection with the cells, which develop into members of the sieve-tubes.

Dr. Wilhelm finds that the "callous" condition of the sieve-plate is not, as previously supposed, the result of a secondary change of the plate; on the contrary, the differentiation of the sieve-plate begins by the change of the cellulose to "callus" at a number of points. It is in the callus masses, formed at these points, that the pores of the sieve later appear. The callus may extend itself from these points so as to cover the whole face of the plate, and completely inclose the cellulose sieve. A callus-skeleton is thus formed which may be isolated.

The callus varies in volume, increasing with age, or on approach of the period of rest; in which case the pores may be completely stopped; or decreasing as the period of summer activity approaches, when the pores are again opened. This result may be obtained by artificial means. It is best seen in Vitis; it is probable that this variation of volume of the callus is by no means universal.

As regards the substance of the callus it will be seen from the following reactions that it cannot be identified with any of the substances previously described. With acids and alkalies it swells quickly; if the reagents be strong it is dissolved. Ammoniacal sub-oxide of copper attacks it only slightly, or not at all; by use of this reagent the callus-skeletons before mentioned may be obtained free. Solution of iodine in alcohol does not colour it; solution of iodine in potassium iodide colours it yellow to brownish yellow. This with Schultz's solution gives a deep red brown; when used alone the latter reagent gives no colour, but causes considerable swelling.

Thus far we have only discussed the cell walls. While the development of the sieve has been going on, but before the perforations are formed, a change appears in the contents of the young sieve-tubes. Isolated drops or irregular masses appear in the layer of protoplasm lining the cell cavity before the disappearance of the nucleus. These consist of a slimy stuff (*Schleim*) apparently rich in nitrogen.[1] The separate masses later fuse together to form a band, which is usually much narrower than the girth of the cell. Between this and the wall of the sieve tube a protoplasmic envelope intervenes (*Hüllschlauch*). The central cavity within these is filled with "sieve-tube sap." For further details concerning the contents of the sieve-tubes the reader must be referred to the original work.

---

[1] The sieve tubes were discovered by Hartig (1837). His observations were many years after verified by other observers, especially von Mohl, Nageli, and Hanstein

[2] De Bary, "Vergl Anat.," p. 337.

The author has not been able to observe directly the first appearance of connection through the pores of the sieve; but suggests that it is effected by the outgrowth of protuberances of the envelope (*Hüllschlauch*) from opposite sides of the sieve, which penetrate it and coalesce to form the connecting strings.

The presence of starch grains noticed by Briosi is confirmed by Wilhelm in Vitis. He finds them in members of sieve-tubes which are still closed. He opposes the idea that they pass through the sieve on ground of their size. In Cucurbita and Lagenaria they are absent. Besides the communication of sieve-tubes with one another laterally, so as to form a complete system, Dr. Wilhelm has observed in the case of Vitis a further connection, through the medullary rays, of tubes lying on opposite sides of the ray. This is effected by special sieve tubes, produced by transformation of cells of the medullary ray, so as to form a series of very short members; these correspond in development and structure with the ordinary sieve-tube. They traverse the medullary rays in an obliquely tangential direction. Such communications are not found in Cucurbita or Lagenaria.

The question of function has not been solved by these observations. Dr. Wilhelm still holds the view, propounded by Nägeli, that the function of the sieve-tube is the transference of indiffusible substances from place to place in the plant.

In conclusion it may be remarked that the paper is well written, but that it is of such a character as to be interesting only to the specialist. The plates, of which there are nine, are executed with great skill and exactitude.

F. ORPEN BOWER

OUR BOOK SHELF

The Elementary Geometry of Conics. By C. Taylor, M.A. Third Edition. (Cambridge: Deighton, 1880.)

MR. TAYLOR has been before the public as a writer on geometrical conics since 1863, in which year he brought out his "Geometrical Conics"; in 1872 we have the first edition, and in 1873 the second edition of his "The Geometry of Conics," a smaller work than his first book (1863). Now we have a third edition with the above title. In May, 1875, Mr. Taylor, in a paper entitled "On the Method of Reversion applied to the Transformation of Angles" (read before the Mathematical Society, and subsequently printed in a more extended form in the *Quarterly Journal*, No. 53, 1875, with the title "The Homographic Transformation of Angles"), called attention to a "neglected work on conics by G. Walker, F.R.S. (1794)": in this work we first meet with the properties of a circle, which Walker calls the *generating circle*, but which Mr. Taylor, in the work before us, styles the *eccentric circle*; in the free use of this circle consists the main feature in the alterations made in this new edition; further, though still keeping well in view the proving chord-properties independently of tangent-properties, there is a rearrangement of the text; so that the two properties are not treated of in distinct chapters. In other ways also we think this little work is improved, but we need say no more upon a third edition.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*]

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

Ceraski's New Variable Star

UNLESS the principal fact mentioned below has already come to your notice, you may like to bring it before the astronomical public in the columns of NATURE.

The true period of the variable star recently discovered at Moscow (*Durchmusterung*, zone + 81°, No. 25) appears to be two days and a half, instead of five as given in NATURE, vol. xxii. p. 455. Minima were observed at the Harvard College Observatory on September 23 and 28. The changes of the star will accordingly be visible in England on October 13, 18, 23, 28, &c., during the three or four hours before or after midnight. The rapidity of the change is probably greater in the case of this star than in that of any other known variable, the variation exceeding a magnitude in the course of one hour. The total variation is more than two magnitudes. A star of about the eighth magnitude (No. 30 of the same zone) is within a few minutes of the variable, and may readily be compared with it. The phenomenon of the variation is consequently a striking one, even as seen in a small telescope. The approximate place of the variable for 1881 is in R.A. 0h. 51m. 48s., Decl. +81° 14′·1.

EDMUND C. PICKERING

Harvard College Observatory, Cambridge, U.S., October 2

LORD LINDSAY'S Dun Echt Circular, No. 10, which I received on Saturday morning, October 23, prepared me to watch for a probable minimum of M. Ceraski's remarkable variable star B.D. + 81°.25′ on the same night. From my observations the minimum appears to have occurred at about 11h. 10m. G.M.T., the star then being of about 9·1 magnitude. At 9h. 5m. I noted it about equal to a neighbouring star, B.D. + 81° 30′, which I gauged 8·1 mag., and at 13h. 50m. it had regained the same magnitude. When about minimum I thought the variable to be slightly ruddy, but as it brightened up again it lost this tint and appeared to be white, or bluish white, as when I first observed it. It has a small bluish 11½ mag. companion, the P. and D. of which I roughly estimated to be 60° and 10″ respectively. The star was observed by Carrington in 1855, on December 19, 21, and 30, his estimated mags. being 8·0, 8·0, 9·0. Possibly the star may have been near minimum at his third epoch.

Knowles Lodge, Cuckfield, October 25 GEORGE KNOTT

"Solid Ice at High Temperatures"

THE interesting results announced by Prof. Thomas Carnelley, of Firth College, Sheffield, in relation to the physical conditions under which *ice* persistently maintains its *solid state* when exposed to the influence of heat (NATURE, vol. xxii. p. 435), deserves some notice. When he speaks of obtaining "solid ice at temperatures so high that it was impossible to touch it without *burning* one's self," it is evident that this *burning quality appertains to the hot vessel containing the ice, and not to the solid ice itself.* For it is obvious that under the given conditions *the temperature of the surface of the ice is kept at least as low as* 0° C. *by the rapid vaporisation of it while in a solid state.*

The phenomenon of a body remaining persistently at a low temperature when surrounded by a hot vessel—through the influence of the rapid change of state—is analogous to the well-known results of Boutigny and Faraday in relation to the freezing of water and mercury in a hot vessel by means of large globules of sulphurous acid and liquid carbonic acid while in a "spheroidal condition." In these cases, notwithstanding the proximity of the hot vessel, the temperatures of the globules of SO_2 and CO_2 are respectively as low as – 10° and – 73° C.

---

[1] Cf. De Bary, "Vergl. Anat.," p. 185.

It has long been remarked by physicists that some substances pass *directly* from the *solid* to the *gaseous* state, without undergoing liquefaction: that is, when heated, *they sublime without melting*. Such bodies, under ordinary atmospheric pressures, have their *boiling* points *lower* than their temperatures of *fusion*; hence they *volatilise* without *melting*. Moreover it has long been known that such substances may be made to *fuse* by subjecting them to an *abnormal pressure* sufficient to *raise* their boiling points *above* their points of fusion. Thus the classical experiments of Sir James Hall show that carbonate of lime may be *fused* when heated under a pressure sufficient to prevent the CO_2 from escaping (*Trans.* Royal Soc. Edin., vol. vi. pp. 71–186, 1805). In like manner metallic arsenic sublimes without melting at 180° C., under the ordinary pressure of the atmosphere; but the experiments of Landolt in 1859 show that under artificial pressure it melts in globules at a low red heat. It is evident that in these cases the *rapid vaporisation* of the solids under ordinary circumstances *prevents* the temperature from reaching the point of fusion; but when subjected to additional pressure the conditions of liquefaction are secured. On the other hand, in the case of *ice*, it is obvious that the *withdrawal of pressure* by *lowering* its boiling-point places it in the same category with metallic arsenic under ordinary conditions of pressure.

In relation to the *literature* of this subject it is proper to add the following quotations from M. V. Regnault's "Elements of Chemistry" (American Translation, Philadadelphia, 1865, vol. i. p. 279). In speaking of the fusion of metallic arsenic under pressure he says:—"The distance between the point of fusion and that of ebullition of any body may, however, be increased at pleasure. For *the point of ebullition of a body is the temperature at which the tension of its vapour is equal to the pressure exerted upon it*; and hence by increasing the pressure the boiling-point is raised without sensibly affecting the point of fusion." Again, he says:—"Reciprocally it is evident that a *volatile solid body* may be always subjected to so slight a pressure that it will *boil* at a temperature *inferior* to that at which it *melts*. Thus ice at the temperature of – 1° C. possesses an elastic force represented by 4·27 mm.; in other words, it boils at a temperature of – 1° C. under the pressure of 4·27 mm. Ice may therefore be entirely volatilised *by ebullition* under this feeble pressure, without reaching its point of fusion, which is 0° C."

Berkeley, California, September 30 JOHN LECONTE

Wire Torsion

THE phenomena described by Major Herschel in his letter to NATURE, vol. xxii. p. 557, and about which he asks for information, are, we think, quite easily explained by what is known of the fluidity of metals. Yielding, or flowing, seems to occur in all metals after a certain limiting stress has been reached; indeed it probably occurs, although perhaps to an immeasurably small extent, even with small stresses (see *Proc.* Roy. Soc. No. 204, p. 411, 1880); but there is generally a limiting stress beyond which the increase of strain due to yielding becomes comparable in magnitude with the ordinary strains, which instantaneously disappear on the removal of the load. The bell-smith pulls his copper wire and makes it much longer before he thinks it fit for use; in a similar way the telegraph constructor stretches, or *kills* the iron wire before he erects the line. Up to a certain limit of pulling force, the wire obeys the well-known laws of elasticity; slightly above that limit there is considerable fluid-yielding, there being but very little yielding below that limit; and at any instant during the lengthening if the man ceases to pull, the wire shortens a little. In fact at any stage the wire obeys the elastic law for *small* stresses. Eventually the man ceases to pull, knowing that the metal has lost most of its fluid properties, which can only be restored to it by annealing. The same thing occurs in brass, although to a smaller extent than in copper, which can be experimentally proved in the following way:—Stretch a piece of well-annealed brass wire in the manner described by Major Herschel until it is nearly breaking; and immediately set the wire vibrating. Now the note given out by the stretched brass wire, which, as is well known, depends on the tensile stress, will be found rapidly to go down in pitch. If the wire be tightened up again sufficiently with the screw, the original note will again be heard, and the pitch will again go down, but not so rapidly as before. Repeat this process until no flattening of the note is heard; then in this state we think that the experimenter will find the wire to break with much less torsion than before, and to obey Hooke's law more exactly. If it be desired to repeat the yielding or flowing process, the wire must be previously again annealed.

Mere sudden straining, even nearly up to the breaking stress, is not sufficient to destroy the fluidity of brass; time is required. The yielding behaviour of a brass beam when loaded has been studied by Prof. Thurston (*Trans.* American Soc. of Civil Eng. vol. vi. p. 28), and we may add that we have found that the permanent state is always more rapidly reached when the wire is subjected to rapid vibrations.

It may be because torsion of a wire is more visible than longitudinal strains (the twist being inversely proportional to the fourth power of the diameter for a given twisting moment, whereas the longitudinal strain for a given load is inversely proportional to the square of the diameter) that fluidity is so much more apparent in torsional experiments; but we think it probable that fluidity will be found always much more apparent when the volume of the material acted on is unchanged, that is, when the stress is mainly one of shear as it is in torsion.

However this may be we can explain why wire which has been "killed" for pulling forces is not "killed" for twisting, and why it is more difficult to kill for twisting than for tensile stresses. It is well known to wire-drawers that in whatever state copper or brass wire may be, whether annealed or not, it may be drawn smaller, although no doubt it requires less care to draw it if it is annealed. We cannot merely pull wire much smaller, it has to undergo a lateral pressure such as the die gives it. Now in twisting a wire it everywhere receives this lateral pressure, that is—imagine a right-handed spiral filament being lengthened by the twist—then the other component of the twist gives to the filament a compression at right angles to its length which enables it to extend. It seems that this lateral pressure is needed to overcome some sort of friction in the particles of the metal tending to prevent their moving into the axis of the wire, and which therefore is greater as the section of the wire is larger, and it is probably for this reason that a very thin wire extends much more, for a given initial length, before it is killed than a thick wire. We have known a length of about fifteen inches of fine copper wire which had just been drawn, and which had been well killed, to bear six or seven hundred complete turns in a lathe, one end being fixed, the other end turned, and the wire kept pretty taut before it was accidentally broken, and even afterwards parts of the wire could be considerably lengthened by pulling. The nature of the explanation of this apparent annealing for tensile stresses arising from previous torsion will be gathered from what follows.

We infer that the three or four turns given to the wire at the beginning in Major Herschel's experiment were not sufficient to produce permanent torsional set; why then should increasing the tension during the torsion cause torsional set as well as lengthening of the wire? This is, we think, a more important question than the one presented to us by the observations of fluidity in the latter half of Major Herschel's letter, and which arose from the metal having belonged to what Prof. Thurston calls the "tin class" as distinguished from metals of the "iron class."

The explanation we think is as follows, and it leads to the conclusion that torsional fluidity is not independent of tensile stress:—

Suppose right- and left-handed spirals had been imagined in the wire in question, making everywhere angles of 45° with the axis of the wire; then torsional strain, however set up, would consist in the production of a difference in length of these two sets of spirals. Now a twisting moment produces this effect; it lengthens, say the right-hand spiral and shortens the left, and we know that up to a certain limit, which is tolerably high, the same effect is produced whatever be the tensile stress in the wire, which latter simply tends to lengthen both spirals equally. In fact if Hooke's law is true, the torsion is independent of the tension. But above a certain limit of pull in the wire, the strain in the direction of the right-handed spiral being everywhere due to the sum of two tensile stresses, becomes so great that fluidity sets in and permanent set is produced; whereas in the direction of the left-handed spiral the stress is due to the difference between the tensile stress and the compressive part of the torsional shearing stress, and this difference being small, no permanent tensile set is produced, or at all events one much less than in the case of the other spiral. Consequently if all stresses now cease to act a permanent difference would remain in the lengths of the two spirals, that is, there would now be a permanent twist.

Information regarding the fluidity of tempered steel, copper, brass, lead, tin, &c., will be found in the papers of M. Tresca, and in the second of the Cantor lectures delivered by Mr. Anderson before the Society of Arts April 19, 1869, as well as in Mr. Anderson's book on the "Strength of Materials," and in Mr. Bottomley's reports communicated at the Meetings of the British Association in 1879-80. We do not think, however, that much of the valuable information on the fluidity of metals which is scattered through the *Proceedings* of the different societies has yet been collated. Wire-drawers, watch and clockmakers, as well as the makers of philosophical instruments and of other small machinery, have a considerable amount of knowledge of this subject which they cannot systematise and make known to others, but which, nevertheless, they make ready use of in their work.

Finally, we would suggest that if Major Herschel wants his wire to obey Hooke's law for small twists only, he will not find it necessary to destroy the properties which are due to its being annealed. If, however, he desires to use greater twists, it will be necessary to leave the wire under a fairly large pull for a considerable time without twisting it until it ceases to continuously yield to tensile stresses of greater intensity than that of the shear stress to which it has afterwards to be subjected. And if in Mr. Allan Broun's gravimeter it be necessary to employ such large twisting couples as Major Herschel was using in his experiments, we would suggest the employment of a longer and thicker wire.

On the Skin-furrows of the Hand

IN looking over some specimens of "prehistoric" pottery found in Japan I was led, about a year ago, to give some attention to the character of certain finger-marks which had been made on them while the clay was still soft. Unfortunately all of those which happened to come into my possession were too vague and ill-defined to be of much use, but a comparison of such finger-tip impressions made in recent pottery led me to observe the characters of the skin-furrows in human fingers generally. From these I passed to the study of the finger-tips of monkeys, and found at once that they presented very close analogies to those of human beings. I have here few opportunities of prosecuting the latter study to much advantage, but hope to present such results as I may attain in another letter. Meanwhile I would venture to suggest to others more favourably situated the careful study of the lemurs, &c., in this connection, as an additional means of throwing light on their interesting genetic relations.

A large number of nature-prints have been taken by me from the fingers of people in Japan, and I am at present collecting others from different nationalities, which I hope may aid students of ethnology in classification. Some few interesting points may here be mentioned by way of introduction.

Some individuals show quite a *symmetrical* development of these furrows. In these cases all the fingers of one hand have a similar arrangement of lines, while the pattern is simply reversed on the other hand. A Gibraltar monkey (*Macacus innus*) examined by me had this arrangement. A slight majority of the few Europeans I have been able to examine here have it also.

An ordinary botanical lens is of great service in bringing out these minor peculiarities. Where the loops occur the innermost lines may simply break off and end abruptly; they may end in self-returning loops, or, again, they may go on without breaks after turning round upon themselves. Some lines also join or branch like junctions in a railway map. All these varieties, however, may be compatible with the general impression of symmetry that the two hands give us when printed from.

In a Japanese man the lines on both thumbs form similar spiral whorls; those of the left fore-finger form a peculiar oval whorl, while those of the right corresponding finger form an open loop having a direction quite opposite to that of the right fore-finger in the previous example. A similar whorl is found on both middle fingers instead of a symmetrically reversed whorl. The right ring-finger again has an oval whorl, but the corresponding left finger shows an open loop.

The lines at the ulno-palmar margin of this particular Japanese are of the parallel sort in both hands, and are quite symmetrical, thus differing from the Englishman's considerably. These instances are not intended to stand for typical patterns of the two peoples, but simply as illustrations of the kind of facts to be observed. My method of observation was at first simply to examine fingers closely, to sketch the general trend of the curves as accurately as possible, recording nationality, sex, colour of eyes and hair, and securing a specimen of the latter. I passed from this to "nature-printing," as ferns are often copied.

A common slate or smooth board of any kind, or a sheet of tin, spread over very thinly and evenly with printer's ink, is all that is required. The parts of which impressions are desired are pressed down steadily and softly, and then are transferred to slightly damp paper. I have succeeded in making very delicate impressions on glass. They are somewhat faint indeed, but would be useful for demonstrations, as details are very well shown, even down to the minute pores. By using different colours of ink useful comparisons could be made of two patterns by superposition. These might be shown by magic lantern. I have had prepared a number of outline hands with blank forms for entering such particulars of each case as may be wanted, and attach a specimen of hair for microscopic examination. Each finger-tip may best be done singly, and people are uncommonly willing to submit to the process. A little *hot* water and soap remove the ink. Benzine is still more effective. The dominancy of heredity through these infinite varieties is sometimes very striking. I have found unique patterns in a parent repeated with marvellous accuracy in his child. Negative results, however, might prove nothing in regard to parentage, a caution which it is important to make.

I am sanguine that the careful study of these patterns may be useful in several ways.

1. We may perhaps be able to extend to other animals the analogies found by me to exist in the monkeys.
2. These analogies may admit of further analysis, and may assist, when better understood, in ethnological classifications.
3. If so, those which are found in ancient pottery may become of immense historical importance.
4. The fingers of mummies, by special preparation, may yield results for comparison. I am very doubtful, however, of this.
5. When bloody finger-marks or impressions on clay, glass, &c., exist, they may lead to the scientific identification of criminals. Already I have had experience in two such cases, and found useful evidence from these marks. In one case greasy finger-marks revealed who had been drinking some rectified spirit. The pattern was unique, and fortunately I had previously obtained a copy of it. They agreed with microscopic fidelity. In another case sooty finger-marks of a person climbing a white wall were of great use as negative evidence. Other cases might occur in medico-legal investigations, as when the hands only of some mutilated victim were found. If previously known they would be much more precise in value than the standard *mole* of the penny novelists. If unknown previously, heredity might enable an expert to determine the relatives with considerable probability in many cases, and with absolute precision in some. Such a case as that of the Claimant even might not be beyond the range of this principle. There might be a recognisable Tichborne type, and there might be an Orton type, to one or other of which experts might relate the case. Absolute identity would prove descent in some circumstances.

I have heard, since coming to these general conclusions by original and patient experiment, that the Chinese criminals from early times have been made to give the impressions of their fingers, just as we make ours yield their photographs. I have not yet, however, succeeded in getting any precise or authenticated facts on that point. That the Egyptians caused their criminals to seal their confessions with their thumb-nails, just as the Japanese do now, a recent discovery proves. This is however quite a different matter, and it is curious to observe that in our country servant-girls used to stamp their sealed letters in the same way. There can be no doubt as to the advantage of having, besides their photographs, a nature-copy of the for-ever-unchangeable finger-furrows of important criminals. It need not surprise us to find that the Chinese have been before us in this as in other matters. I shall be glad to find that it is really so, as it would only serve to confirm the utility of the method, and the facts which may thus have been accumulated would be a rich anthropological mine for patient observers.

[Some very interesting examples of nature-printed finger-tips accompanied this letter.—ED.]

Metamorphic Rocks, Ireland

THERE appears to be confusion as to the times when metamorphic action occurred among the Irish rocks; my experience would point to the following:—

In the Carnsore district, South-East Wexford, there are metamorphic rocks for a long time supposed to be of Lower or Cambro-Silurian age; I however proved that they were upturned, contorted, metamorphosed, and denuded, prior to the overlying fossiliferous Cambro-Silurian rocks being deposited, and for the reasons given in the Geological Survey Memoir it is probable these metamorphic rocks are of Cambrian age.

In the hills north of Pomeroy, Co. Tyrone, there are metamorphic rocks, which were upturned, contorted, metamorphosed, and denuded, prior to the overlying fossiliferous "Pomeroy rocks" having been deposited. The fossils in the latter would point to their being Cambro-Silurians; consequently the metamorphic rocks are older, and for reasons given in a paper read before the Royal Irish Academy I believe they are the equivalents of the "great micalite series," West Galway, or the equivalents of the Arenig group of Wales. Thal is either Upper Cambrian, or *Passage beds* between the Cambro-Silurian and Cambrian.

In Erris, North-West Mayo, there is a tract of excessively metamorphosed rocks, supposed by Griffith to be older than the associated altered Cambro-Silurians, and this opinion is shared in by Mr. McHenry, who more recently examined them.

From the above it is evident that there was a *period of intense metamorphosis prior to the Cambro-Silurian age.*

The Cambrian (Arenig group?) and Cambro-Silurian of Galway and South-West Mayo must, in part, have been altered prior to the deposition of the Upper Silurians on them; while the general metamorphism of the South-East Ireland Cambro-Silurians, *which was quite irrespective of the intrusion of the Leinster granite,* was probably at about the same time. If the Comeragh Mountain rocks are Glengarriff grits, *i.e.* Silurians, the age of the metamorphic action is evident, as in Waterford these rocks underlie those of the Comeragh Mountains. In addition to the general metamorphism in the rocks of South-East Ireland, there was also a local and secondary action in connection with the protrusion of certain granitic rocks.

The testimony of the West Galway and South-West Mayo rocks alone, however, would prove *a period of intense metamorphic action at the close of Cambro-Silurian time.*

In South-West Mayo, as proved by Mr. Symes and myself (*Maps and Memoirs of the Geol. Survey*), there is a considerable area of metamorphosed Upper Silurian rocks, which prove *another period of intense metamorphic action subsequent to the dawn of Upper Silurian times.* The secondary metamorphism previously mentioned in South-East Ireland may also be of this age, as the granitic rocks allied with the metamorphic, in both areas, are very similar.

Thus there are records of at least three periods of intense metamorphic action, and probably there were two others subsequently—one in the Triassic and another in the Miocene time—to account respectively for the metamorphic rocks in the neighbourhood of the Mourne granite, Co. Down, and those associated with the granitic rock near Portrush, Co. Antrim.

Formerly, as mentioned by me in the "Geology of Ireland," the period of greatest metamorphism was considered to have been at the close of the Cambro-Silurian time; now, however, more recent research has taught us that metamorphic rocks, formerly supposed to be Cambro-Silurians, are Cambrians; so it seems possible the metamorphic action prior to Cambro-Silurian time may have been greater than that subsequent to it.

The Number of Known Species of Hemiptera-Heteroptera

As Mr. Pascoe, in his very "handy book of reference" for zoological classification, says of the Hemiptera-Heteroptera that "in round numbers there may be about 10,000 species in this sub-order," I am induced to give my census of the group.

On completing, about a year ago, MS. lists of the families which Stål unfortunately did not live to include in his "Enumeratio Hemipterorum," I was tempted to try and ascertain the total number of species that had been described. This I found to be about 7,800 (the actual number arrived at is 7,780). Of these, 7,445 belong to the Geocorisæ or Gymnocerata (mostly terrestrial bugs, but including four families which inhabit the surface of water), and 334 to the Hydrocorisæ or Cryptocerata (almost all aquatic species). Of the Geocorisæ 1,503 are European, 3,248 are natives of the rest of the Old World, and 2,694 are American; of the Hydrocorisæ the corresponding numbers are 95, 120, and 119. The largest family of the Geocorisæ in Europe is the Capsidæ with 500 species, as against 134 and 312 in the rest of the Old World and America respectively. Amongst the Hydrocorisæ the family Corixidæ is most numerous in species, the numbers being: for Europe 7[illegible], the rest of the Old World 17, and America 34. But as these two families contain many inconspicuous species, and species having a strong resemblance *inter se*, and as Europe has been (naturally) more thoroughly investigated than the other regions, it is likely that many extra-European species of these families remain yet to be discovered.

Of what may be the actual number of species of Hemiptera-Heteroptera existing it is difficult to form an estimate. It is only of late years that much attention (comparatively) has been directed to the order, and from the number of new species sent home by the few collectors who condescend to collect bugs, it is evident that very great additions to the list will in course of time be made. Even within the last twenty years the list has been more than doubled, as in A. Dohrn's catalogue, published in 1859, only 3,627 are mentioned.

Of the sub-order Homoptera it would be rather difficult to make a census. In Dohrn's catalogue somewhere about 3,000 species are catalogued—a number not very far short of that of the Heteroptera. In the British and European lists the number of Homoptera is about two-thirds that of the Heteroptera.

Perth, October 19 F. BUCHANAN WHITE

On the Classification of Rivers

IT has often occurred to me that a convenient classification of rivers might be obtained by arranging them according to their "water-discharge." Such a classification would not only indicate the relative position of one river to another in a descending scale, but would enable a rough estimate to be borne in the memory of the amount of water any particular river may discharge.

I therefore venture to suggest the following arrangement: and have given below the names of seventeen rivers, the discharges of which I have obtained from various sources, for which I would refer the reader to NATURE, vol. xxii. p. 486.

Discharge of Cubic Feet per second

First Rate. Above 2,000,000.	Second. Above 1,000,000.	Third. Above 500,000.	Fourth. Above 250,000.	Fifth. Above 100,000.
Amazon.	Congo.	Yang'tse. Plate. Mississippi.	Danube. Shat-el-Arab.	Ganges. Indus. Atrato. Nile. Yellow River.
Sixth. Above 50,000.	**Seventh. Above 25,000.**	**Eighth. Above 10,000.**	**Ninth. Above 5,000.**	**Tenth Below 5,000.**
Rhone. Rhine. Po.			Pei-ho.	Thames.

Woodlane, Falmouth, October 19 H. B. GUPPY

Yuccas under Cultivation

IN NATURE, vol. xxi. p. 315, in the report of the *Proceedings* of the Linnean Society, it is stated that "the yuccas fruit rarely under cultivation, the large white pendulous flowers being in the wild plant fertilised by a moth of the genus *Pronuba.*" The yucca has been introduced and is very abundant in this colony, especially round Noumea. It fruits freely; in fact I rarely see a plant in which many, if not most, of the flowers do not produce seed-pods. In my own garden they seem to be fertilised by the common bee, of which I have a hive, others being in the neighbourhood. If I remember rightly, *Pronuba* is a genus of large moths having yellow underwings. We have a species identical with, or closely resembling, an old Ceylon friend, but it is rare; still it does exist here, and *may* assist in the fertilisation, though I should say, from the number of flowers fertilised, that other agencies preponderate. E. L. Layard

British Consulate, Noumea, New Caledonia, July 31

Intellect in Brutes

I confess I do not see much "intellect" in a snake biting its own tail (cf. Nature, vol. xxii. p. 40); on the contrary, I consider the creature evinced remarkable stupidity. Perhaps however you will think what I now relate will show that snakes do possess reasoning powers.

Many years ago, while in Ceylon, I lived in a house in "Slave Island," raised on a high platform. The steps up to the door had become loosened, and behind them a colony of frogs had established themselves. One morning I watched a snake (a cobra) creep up, insert his head into a crack, and seize a frog, which he there and then swallowed. But the crack that admitted the thin flat head and neck of the ophidian would not permit of the same being withdrawn when the neck was swollen with the addition of the frog inside it. The snake tugged and struggled, but in vain, and after a series of futile attempts disgorged its prey and withdrew its head. But the sight was too tantalising. Again the head was inserted in the crack and the coveted morsel swallowed, and again the vain struggles to withdraw were renewed. *I saw this repeated several times*, till, gaining wisdom by experience, the snake seized the frog by one leg, withdrew it from its coigne of vantage, and swallowed it outside. E. L. Layard

---

I send you the following dog story, the truth of which is vouched for by the young lady who owned the animal. Her pet dog, a black-and-tan-terrier, was well known to the neighbours for his intelligence. He had established a remarkable friendship for a certain kitten, although given to fierce attacks on all others. This kitten was infested with fleas, which, when the dog discovered, he took her by the nape of the neck, in truly parental fashion, and *soused her up and down in a bucket of water*. He would then take her out into the sunshine and carefully pick out the drowned fleas.

A friend of mine, a naturalist, and a very conscientious man, whose word can be implicitly trusted, gives the following, to which he was an eye-witness. His grandfather, then a very old but hale and hearty man, had a splendid Newfoundland. There was a narrow and precipitous road leading from the fields to the house. It was regarded as a very dangerous place. One day when the old gentleman was doing some work about the farm his horse became alarmed and started off with the wagon along this causeway. The chances were that he would dash himself and the empty wagon to pieces. At once the dog seemed to take in the situation, although until that time he had been impassive. He started after the horse at full speed, overtook him, caught the bridle, and by his strength arrested the frightened creature until help could reach him. My friend gives many other stories of this fine dog, and thinks he had a decided sense of humour. I will repeat that both of these tales come to me well authenticated, and I could, by seeking permission, give names and places. W. Whitman Bailey

Brown University, Providence, R. I. (U.S.A.), October 10

Atmospheric Phenomenon

Last evening (October 21) at 5.45 p.m. I observed four huge radiating arms of faint white light, like the spokes of a gigantic wheel, rising from a centre apparently on the west-south-west horizon, and extending almost to the zenith. I say apparently on the west-south-west horizon, because an intervening house prevented me from seeing the nucleus of the diverging rays. The aspect of the phenomenon was more suggestive of an aurora than anything else I know of, but the beams of light seemed to be quite stationary, and although I fancied their brilliancy increased at one time for a few moments, I cannot be sure. Other fainter rays appeared to me to divide the west-south-west sky with those I have mentioned; but on that point I am also not sure. The sun set at 4.53 p.m., and twilight ended about 6.43 p.m., at which time the appearance I have attempted to describe was no longer visible. The sky was heavily clouded.

I should very much like to know the cause of this (to me) singular exhibition of light. B.

Kentish Town, N.W., October 22

Temperature of the Breath

With reference to the high reading, 107°-108°, noticed by Dr. Dudgeon when a thermometer tightly wrapped up in the folds of a silk handkerchief was kept in the mouth for five minutes, might I ask Dr. Dudgeon if he has verified this reading by immersing the thermometer, with a handkerchief tightly rolled round its bulb, in a vessel of water, at say 108°, the temperature of the water being simultaneously taken by a standard thermometer with its bulb uncovered? It seems to me that there is some danger of actually squeezing up the reading of a delicate thermometer when twenty or thirty folds of a silk handkerchief tightly encircle its bulb. F. J. M. P.

October 23

Crossing Rapid Streams

Having read some letters lately in your paper on the subject of crossing rapid streams by means of carrying heavy stones, it strikes me that the following may be of interest to your readers. It is an extract from a survey report by Lieut. (now Major) Woodthorpe, R.E., written in 1876, describing the method, which he saw practised by men of the Nàgà tribes, for crossing a deep stream too rapid for their feeble powers of swimming, and about twenty yards wide:—

"Taking large stones in their hands, they waded in up to their necks, and throwing up their legs and lowering their hands, the stones carried them to the bottom, along which they crept on all-fours till they reached the shallows on the other side."

The rough bottom afforded them sufficient hold to withstand the modified current and resist flotation. C.

Mussoorie, September 28

Construction of Telescopes and Microscopes

Perhaps some of your readers may be able to inform me whether there exists in English or French a work on geometrical optics, in which the author applies himself thoroughly to explain the optical (not the mechanical) construction of telescopes and microscopes. Works like those by Parkinson and Potter stop short exactly where the application of theory to the construction of the best instruments begins. P. C.

September 30

BENJAMIN PEIRCE, F.R.S.

We regret to have to record the death at Cambridge, Mass., on October 6, of Prof. Peirce of Harvard University, following upon an illness of three months from Bright's disease. Prof. Peirce was the son of a former librarian of the university, Benjamin Peirce, who died in 1831. For the past thirty-five years he has occupied a professorship at Harvard; and as a lecturer, author, thinker, and investigator, has not only ranked amongst the first of a numerous corps of professors, but also among the first of American men of science. Devoting himself originally to mathematics, Prof. Peirce has successively pursued exhaustive studies in all the branches more closely allied to mathematics, and has obtained eminence equally in physics, astronomy, mechanics, and navigation. His numerous investigations in these various departments, while read before various scientific societies, have been published, unfortunately, for the most part in the briefest possible form, and the results of many of his researches are to be found only in the manuals he published on various subjects. As an author Prof. Peirce was highly esteemed upon both sides of the Atlantic, his work on analytical mechanics, which appeared in 1857, being regarded then even in Germany as the best of its kind. His chief works are a "Treatise on Algebra," a "Treatise on Plane and Solid Geometry," "Pure Mathematics," a "Treatise on Sound," "Ocean Lanes for Steamships," "Tables of the Moon," "System of Analytic Mechanics," "Potential Physics," "Linear Associative Algebra," "Analytic Morphology," and "Criterion for the Rejection of Doubtful Observations." As a lecturer Prof. Peirce was highly esteemed in both scientific and popular circles. It is related that in 1843, by a series of popular lectures on astronomy, he so excited the public interest that the necessary funds were supplied for erecting an observatory at Harvard. A remarkable series of lectures on "Ideality in Science," delivered by him in 1879 before the Lowell Institute in Boston, attracted the general attention of American thinkers, on account of the thoughtful consideration of the vexed question of science and religion.

Much of Prof. Peirce's activity was absorbed by his duties as the head of the American Coast Survey, a position in which he succeeded Prof. Bache. He brought to this work the same degree of zeal and ability which were so brilliantly evidenced by his predecessor, and constantly maintained the well-earned reputation of the Coast Survey among the hydrographic efforts of our day. Prof. Peirce was one of the founders of the American National Academy of Sciences. In 1853 he presided over the American Association for the Advancement of Science. The degree of LL.D. was conferred upon him twice, by the University of North Carolina (1847), and by Harvard University (1867). He was elected an Associate of the Royal Astronomical Society (1849), and a Fellow of the Royal Society of London (1852), and of the Royal Societies of Edinburgh and Gottingen.

Prof. Peirce leaves behind him his wife, a daughter, and three sons. Of the latter one is Professor of Mathematics at Harvard, and another is Professor at Johns Hopkins University.

RECENT CHEMICAL RESEARCH

THE masses of facts accumulated in the text-books on chemistry are already portentous: each month, almost each week, adds to the store.

The difficulty of getting a stable standing-ground from which to survey, in order, if possible, to find the meaning of these facts, increases likewise.

Fortunately from time to time there are found investigators who, turning from the easy toil of adding new compounds to those which are as yet but imperfectly known, concern themselves with the fundamental questions of chemical science.

Why are the properties of bodies so largely modified under certain conditions? This is the all-important question for the chemist. Before this question can be answered for a series of substances the properties of those substances must be accurately known, and the variations in their properties under varying conditions—themselves definitely ascertained—must be determined. Among the properties of substances those which we usually call physical are, as a rule, more susceptible of accurate measurement than those which we call chemical.

But these physical properties must be connected in some way with the chemical structure of the little parts, or molecules, of which we conceive the substances to be built up.

To determine what this connection is in the case of a definite physical property, and for a series of chemical substances, is at present one of the most promising problems which presents itself to the chemical inquirer.

But these physico-chemical problems require for their solution, a practical knowledge both of chemical and physical methods; methods of laboratory work and methods of reasoning on the results obtained. Students of nature trained in both methods are not extremely abundant.

The suggestion made in the preface to Armstrong and Grove's new volume on Organic Chemistry, that each chemical school should regularly prepare special series of pure compounds, and should let it be known that physical observers can procure these compounds in order to determine their physical properties, is well worthy of being acted on by all in whose hands may rest the arrangement of the work of any chemical school.

The older method of regarding chemical physics as consisting of a little chemistry loosely tacked on to a great deal of ordinary physics, is disappearing; and chemists and physicists now recognise that the problems which each attacks are, in very many instances, but different aspects of the same question.

The more thoroughly the chemical worker is trained in the correct use of dynamical principles and dynamical reasoning, the more likely is he to succeed in his search for chemical truth.

Very recently two papers have appeared, the contents of which illustrate the importance of the results obtainable by physico-chemical methods.

Bruhl has published in Liebig's *Annalen*—and in a condensed form in the Berlin *Berichte*—the results of his investigations on the connection between physical properties and chemical constitution of carbon compounds; and Thomsen, in the *Journal für practische Chemie* (and also in the *Berichte*) has given the first two instalments of his thermal work bearing on the isomerism of carbon compounds.

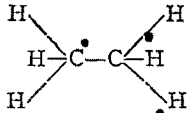
I propose to give a short account of the work of these two chemists: let us begin with Thomsen's.

The "heat of formation" of a compound substance is the difference between the sum of the heats of combustion of the constituent elements of the compound, and the heat of combustion of the compound itself. But this heat is not the true "heat of formation" of the molecule of the compound; it is only the algebraic sum of various heat disturbances. The thermal change which accompanies the formation of a compound molecule from various elementary molecules consists of various parts: (1) heat absorbed in dissociating the molecules of the different elements; (2) in some cases, heat absorbed in liquefying or gasefying the constituent elements; (3) heat evolved in the formation, from the dissociated elementary atoms, of the new compound molecules; and (4) in some cases heat evolved in the liquefaction or solidification of the gaseous compound molecules. If the physical state of the various substances concerned be constant throughout the experiment, (2) and (4) may be neglected; and the heat of formation will be equal to the difference between the heat absorbed in splitting the elementary molecules, and that evolved in the falling together of the atoms so produced, in the new configuration. The value of the first part of this operation will always be constant for the same element or elements; but the value of the second part will depend upon the configuration assumed by the elementary atoms in the new compound molecules.

Now the generally accepted chemical theory of isomerism is that it (isomerism) is dependent on varying configuration of the same atoms. Some chemists have urged that isomerism is more probably due to the possession, by the different compounds, of different amounts of energy. But these two theories are really parts of the same theory. Thomsen's method, indeed, may be said to be based on this fundamental identity.

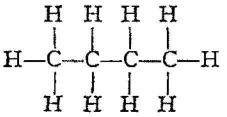
Given the dissociated elementary atoms, they may arrange themselves in various ways, each arrangement will be attended with a definite but different evolution of heat, hence, inasmuch as the heat absorbed in the preliminary elemental dissociation is fixed, the heats of formation of the various isomeric molecules will be different.

But when it is said that isomerism depends on atomic configuration, two things are included in this statement. Let us consider isomerism in a hydrocarbon: the carbon atom combines with four, and not more than four, hydrogen atoms to form a compound molecule. The carbon atom is said to be tetravalent; this is usually graphically expressed by the symbol $=\mathrm{C}=$. The maximum number of hydrogen atoms which two carbon atoms can combine with to form a definite molecule will be six, and the molecule will be graphically represented as

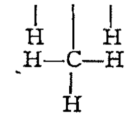


. But we also know of a compound the molecule of which contains two carbon, but only four hydrogen atoms, this is represented as $\frac{H}{H}\!>\!C{=}C\!<\!\frac{H}{H}$, and a third hydrocarbon, C_2H_2, is represented as $H-C \equiv C-H$. In the first molecule the carbon atoms are commonly said to be "singly-linked," in the second "doubly-linked," and in the third "trebly-linked." We do not as yet attach any definite physical conception to these phrases; a compound said to contain "singly-linked" carbon atoms is, as a fact, incapable of combining with hydrogen or other monovalent element, whilst a compound said to contain "doubly-linked" carbon atoms can combine with two monovalent atoms for each pair of doubly-linked carbon atoms it is represented as containing; and a compound said to contain "trebly-linked" carbon atoms is capable of combining with four monovalent atoms for each pair of trebly-linked carbon atoms in the graphic formula thereof.

These are instances of isomerism said to be due to differences in the linking of the atoms of the isomeric molecules. But according to the generally accepted theory isomerism may arise among hydrocarbons in which all the carbon atoms are singly-linked; such isomerism is due to different relative arrangements of parts of the molecule. We may suppose all the carbon atoms arranged in a chain, or we may suppose ramifications of these atoms; thus the hydrocarbons represented as



and



would be isomeric.

Thomsen deals only with isomerism due to differences in the linking of atoms. If from a certain number of dissociated carbon and hydrogen atoms a compound be produced containing only "singly-linked" carbon atoms, that compound is not capable of taking up any more hydrogen; but if a compound be produced containing "doubly-linked" carbon atoms, that compound is capable of taking up more hydrogen. But in the act of combining with more hydrogen, heat will be evolved; hence the heat of formation of the first compound is greater than that of the second. The heat of formation of an isomeric compound containing "trebly-linked" carbon atoms would be less than that of either of the preceding.

Thomsen, from the results of his own and other experiments, has calculated the heat of formation, from amorphous carbon, of a pair of singly-linked, a pair of doubly-linked, a pair of trebly-linked, and a pair of quadruply-linked carbon atoms. From these values he has calculated the heats of formation of isomers containing singly, doubly, or trebly-linked carbon atoms. The calculations involve certain assumptions, but the applications of his results to actual hydrocarbons show very close agreement between the calculated and the actually determined "heats of formation."

Thomsen furnishes us with a thermal value for the formation of each of the three possible linkings of the group C_2 in the molecule of compounds. The value of this result to the chemist is great; a determination of the heat of combustion of a hydrocarbon may now yield him much information as to the structure of the molecule of that hydrocarbon.

Thomsen's results also strengthen the commonly-accepted theory of isomerism, and they point towards a dynamical explanation of this theory and to the possibility of attaching a definite physical idea to the phrases "singly" or "doubly-linked" atoms.

As Thomsen has succeeded in tracing a quantitative connection between the heats of formation of certain molecules containing carbon and the linking of the carbon atoms in these molecules, so Brühl has shown that the linking of carbon atoms exerts a definite, measureable influence on the *molecular refractions* of compounds of this element.

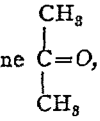
Landolt showed many years ago, that in many compounds, the atoms of each elementary substance, possessed a definite specific refractive capacity independently of the way in which the atoms might be grouped.

Molecular refraction is defined as $\left(\frac{\mu - 1}{d}\right)$. M, where μ = refractive index, d = density of substance, and M = molecular weight.

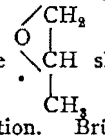
The difference between the molecular refraction of a compound containing carbon, hydrogen, and oxygen, and that of a compound containing the same number of carbon and hydrogen atoms, but free from oxygen, gave the atomic refraction of oxygen. Numbers were thus found expressing the atomic refraction of carbon, hydrogen, oxygen, and a few other elements. Gladstone and Dale showed, however, that the observed molecular refractions of many carbon compounds, especially the compounds existing in essential oils, were greater than the refractions calculated from Landolt's numbers: it seemed that the grouping of atoms did exert, in certain cases, an influence on the refractive power of molecules.

Brühl finds that certain groups of isomeric carbon compounds possess but one molecular refraction; in these groups the refractive power of the molecules is independent of the grouping of the atoms; in other isomeric groups, however, the molecular refraction varies. The members of the latter groups of isomers are always represented in structural formulæ as containing "doubly-linked" carbon atoms. Now if the molecular refraction be conditioned by the linking, but not by the grouping, of the atoms in the molecule, it follows that the atomic refraction of each monovalent element must be a constant number, inasmuch as there is but one way of linking a monovalent atom to other atoms. Such isomers as ethylene chloride, ClH_2C-CH_2Cl, and ethylidene chloride, Cl_2HC-CH_3, should possess the same molecular refraction. But the atomic refraction of any polyvalent atom, *e.g.* oxygen, must vary according as the atom is linked by one, two, or more "bonds" to other atoms: such isomers as allylic alcohol

, acetone



and propylene oxide



should possess each a distinct molecular refraction. Brühl's actual results confirm these deductions. There is then a definite value for the atomic refraction of the carbon, or oxygen, atom according as that atom is "singly-linked" or "doubly-linked" to other atoms: in other words, the molecular refraction of a compound containing the group $>C-C<$ is different from that of the isomer containing the group $>C=C<$; and the molecular refraction of a compound containing the group $>C=O$ is different from that of the isomer containing the group  $>C{-}O{-}$. Bruhl obtains a definite numerical value for the refractive power of each of these groups.

Now although the molecular refraction of isomers with similarly linked, but differently grouped, carbon or oxygen atoms is constant, the refractive indices and the densities of these isomers are not the same. There is, therefore, a definite connection between the densities and refractive indices of carbon compounds, and the grouping, as distinguished from the linking, of the atoms in these compounds. The densities and refractive indices of the isomers, ethylene chloride and ethylidene chloride (see *ante*) are not the same. Bruhl has not determined any exact numerical value for the refractive power of this or that grouping of carbon or other atoms; generally, however, he has shown that the more ramifications there are in the structural formula of a carbon compound, the smaller is the density and the smaller the refractive index of that compound. Thus the density of butylic iodide, $CH_3{-}CH_2{-}CH_2{-}CH_2I$, is 1·6166, and the refractive index (μ) is 1·49601; but the density of the isomeric isobutylic iodide,  $\begin{array}{c}CH_3{-}CH{-}CH_3\\ |\\ CH_2I\end{array}$, is 1·6056, and the refractive index is 1·49192.

Generally, then, it would appear that when rays of light pass through a series of isomeric carbon compounds, the isomerism of which is traceable only to differences in the grouping of the constituent atoms, then that ray which passes through the densest compound is more bent from its original course than any of the other rays; but that when isomerism is due to differences in the linking of the atoms, then the amount to which the rays are bent is dependent not only on the density, but also on the molecular "structure" of the compounds.

Bruhl considers also the connection existing between the boiling points, and other physical constants, of isomeric carbon compounds containing only singly-linked polyvalent atoms, *i.e.* compounds the isomerism of which is due only to variations in the grouping of the atoms, and the structural formulæ of these compounds. His results establish a considerable probability in favour of the rule, that in such isomeric groups, those compounds which have the smallest molecular volumes, have also the highest boiling points, greatest specific gravities and refractive indices (*not* greatest *molecular refraction*), and longest time of flow through capillary tubes; and very probably these compounds have also the smallest amount of ramification in their molecular structure.

Brühl thus put into the hand of the chemist another means whereby he may readily learn much concerning the inner structure of the substances which he examines. Brühl's results, as also those of Thomsen, exhibit a close connection between physical properties of compounds and the valency, or specific saturation power, of the elementary atoms which build up these compounds.

As the theories of modern chemistry are so largely based on the idea of valency, the results of Brühl and Thomsen are most welcome, as at once tending to confirm the general soundness of the methods of the Newer Chemistry, and exhibiting at least two measurable physical phenomena as closely connected with the exercise of valency.

The results of both observers emphasise the difference which chemists have long recognised between two kinds of isomerism: that due to "grouping," and that due to "linking" of atoms. Is it not at least possible, in view of these results, that a greater part of the chemical energy of molecules containing doubly (or trebly) linked polyvalent atoms is kinetic, than is the case in isomeric molecules, the atoms of which are all singly-linked? if indeed the chemical energy of the latter molecules be not wholly potential. Double-linking might then mean greater kinetic energy; and the entropy of a molecule containing only singly-linked atoms would be greater than that of its isomer, some of the atoms in which were doubly-linked.

The consideration of valency of atoms is closely connected with the more general subject of chemical affinity; and the work of Thomsen and Brühl suggests many questions connected with affinity which press for answers.

A short account was given in this journal (vol. xx. p. 530) of the work of Guldberg and Waage, and of Ostwald, on chemical affinity. The latter naturalist has recently extended his methods of observation: in his earlier papers he used physical methods, determining the changes in the specific volumes, and also in the refractive indices, of solutions of acids and bases when these acted chemically on each other, and hence calculating the amount of chemical action. Ostwald now employs a more purely chemical method; he allows acids of known strength to react on a solid salt in excess, and determines the amount of action at definite intervals. His results, so far as they have extended,[1] strikingly confirm the numbers which he before obtained for the relative affinities of the commoner acids.

The application of the theory of Guldberg and Waage to reactions between a solid and a liquid, the former being in excess, requires that a definite and stable condition of equilibrium should be reached at the expiry of not too great a time. Doubt was thrown on Ostwald's results because it was said that such equilibrium had not been attained. In his latest paper Ostwald has carefully examined this point, and has shown that the required equilibrium is attained, and maintained, and that therefore such reactions are well suited for the study of general problems of affinity. Ostwald's future results, as he extends the application of the chemical method, will doubtless be very interesting.

All the work which has been here shortly noticed tells unmistakably that chemistry is rapidly passing out of the natural history stage of progress into that stage where her facts will be accurately grouped under general laws, which laws will admit of quantitative statement, and of quantitative deductions being made from them.

The recent work in chemistry also illustrates the need of a wide training in the methods of various sciences for the investigator of this branch of natural phenomena. One man begins with a purely chemical investigation, another with one which appears wholly physical; before long they find that their paths meet, and that the problem which each had attacked without thought of the other, can be solved, and even then solved but partially, only by the united effort of both.

M. M. PATTISON MUIR

JAPAN[2]

I.

MR. MURRAY is to be congratulated on being able to bring out simultaneously two such excellent books on a country which for some years has probably attracted more interest than any other country in the world. Although they both treat of the same subject, they differ much in their method of treatment. Indeed the one may be said to be complementary of the other; and any one who reads them both with care will be able to form a very complete idea of the present condition of an unusually interesting country and people. Sir Edward Reed went out practically as the guest of the Japanese Government, and had ample opportunities of seeing the official side of the life of the country, of gaining a knowledge of what is being done to graft the results of Western civilisation on a civilisation centuries older, and which has been developed on totally different lines. From first to last he was in the hands of the leading Government officials of the country, who spared no pains to make his visit as pleasant as it could possibly be. During the whole of his three months' visit to the country, from the beginning of January, 1879, he had seldom an hour to himself, and what time he could subtract from his sleep was given to the writing up of his notes on his day's work, for work it must have been, harder than even an obstruction night in Parliament. From the young Mikâdo down to the most subordinate provincial official, every one was anxious to convince the great English engineer that the enthusiasm with which they received him was genuine, and that they would only be too glad to let him inspect every detail of the great work they were endeavouring to carry out for their country. From beginning to end his visit to the country was a triumphal progress, and, as might have been expected, Sir Edward Reed left the country with a high opinion of its Government, and deeply impressed with the genuineness and thoroughness of its progress. Miss Bird, on the other hand, went to Japan, as she went to the Sandwich Islands and the Rocky Mountains, solely in pursuit of health, which she sought and found by travelling alone in those parts of the country rarely if ever frequented by foreigners, living in common inns and humble houses, and finishing up with a sojourn among that curious people known as the Ainos, the probable aborigines of Japan. She of course had every protection which the influence of Sir Harry Parkes, our representative, could procure her, and her passport was powerful enough to secure a courteous reception wherever she went; indeed she found travelling safer in Japan than it is in some European countries. To some extent it may be said that Sir Edward Reed was shown the outside and the brightest side of Japanese life, while Miss Bird plodded her way through the unfrequented heart of the country, and saw much of the light and shade in the everyday life of the common people. The two travellers had this in common, that no obstacle was put in the way of their seeing all that they desired to see, leaving one with the conviction that the Japanese Government has really nothing to conceal, and that their enthusiasm for progress is, for the present at least, genuine. Thus the two works, as we have said, afford a fairly complete picture of all sides of Japanese life.

---

[1] His papers are in the *Journal für practische Chemie* of the last and present year.

[2] "Japan: its History, Traditions, and Religions, with the Narrative of a Visit in 1879." By Sir Edward J. Reed, K.C.B., F.R.S., M.P. Two vols. With Map and Illustrations. (London: John Murray, 1880.) "Unbeaten Tracks in Japan." By Isabella L. Bird. Two vols. With Map and Illustrations. (Same Publisher.)

Sir Edward Reed's headquarters were of course at Tokio, where he was courteously received by the young Emperor, who impressed him as a man thoroughly anxious to do the best he can for his people, but old and careworn beyond his years from the many trials he has had to undergo since his accession. Here he met with most of the ministers and other public officials, and he has a good word to say about every one of them. All the public sights were of course seen, and especially the great temples, both Shinto and Buddhist. Indeed a great part of the narrative is occupied with accounts of the numerous temples visited by Sir Edward, their architecture, ornaments, relics, and history, and the legends connected with them; and they seem to be all so much alike that we think some of the space thus occupied might have been devoted to other details of his interesting journey. After a month's stay in Tokio, Sir Edward and his son, who accompanied him, and a few of whose interesting notes are embodied in his father's narrative, were taken in a lighthouse steamer round the south coast of the main island through the Inland Sea to the outside of Shimonoséki Strait. The number of excellent lighthouses, constructed on the very latest principles, is remarkable in a country whose adoption of Western institutions is scarcely ten years old. Various points on the coast were touched at, and the vessel finally left at Osaka. From this point the journey into the interior of the main island and back to Yokohama was performed in those curious man-cabs known as "jinriki-shas," which were only introduced seven years ago, but which look as long-established as cabs in London, up to Kioto, the old capital of the country, down to the sacred city of Nara, and back by the ancient Shinto shrines of Isé, at the south entrance to Owari Bay. During this busy journey the time not devoted to inspecting Shinto and Buddhist temples was spent in visiting public works of various kinds, manufactories, schools of all grades, dining, mostly in Japanese fashion, and being amused by dances and other spectacles of a strictly indigenous kind. How much the great bulk of the people have yet to learn is evident from the fact that in many parts of their route through the most frequented part of the country the people would crowd to the doors and run from their work in the fields to get a look at the "Chinese" riding in their jinriki-shas.

It would be impossible to give the reader any idea of one-tenth of the things which Sir Edward Reed saw and which he tells about. As an engineer he was naturally much interested in the public works and manufactures of the country, and the magnitude of some of the Government factories, and the perfection which they have already reached, impressed and delighted him. Even the engineering feats of Old Japan astonished him sometimes, as in the case of the great blocks of stone in the castle of Osaka, the beauty and grandeur of which he says it would be impossible to exaggerate. "The whole or most of the walls are notable for these very large blocks of granite, which vie with the largest of those built into the great pyramid of Cheops, near Cairo, in Egypt; but as the main entrance to the castle proper is approached, one sees block after block of the most astonishing proportions, until at and opposite to the entrance itself are single stones of such immense size that one is almost driven to doubt whether his senses are not deceiving him. It is so difficult to understand how such huge masses can have been quarried, transported, raised to such a height, and there worked into walls. I could not conveniently measure the largest stones, but I feel sure that some of them must be over twenty feet in height, nearly twice that in length, and several feet thick, and must weigh three hundred to four hundred tons."

Into their paper-manufacture the Japanese have introduced the best modern machinery, and paper has for centuries played an important part in the everyday life of the Japanese. Partitions, table-cloths, napkins, curtains, carriage-covers, and innumerable other things are made of this material, and Sir Edward thinks it would be a good thing to introduce some of the articles thus made into our own country. He paid much attention to the native art of the country, of which it is evident we have the most erroneous ideas. The ordinary reproductions of Japanese pictures which we see here, are wretched caricatures, and in this as in many other points we have much to learn before we have any adequate idea of the real nature of Japanese civilisation. They have ever so many schools of art going back for centuries, and many of their pictures are well worth studying, and capable of affording genuine pleasure. Their method of producing their famous lacquer-work, and their various contrivances for casting, interested him greatly, and he gives much curious information on these and similar matters.

Some idea of the multifarious industries of the country and of the zeal of the Government in encouraging them may be gathered from Sir Edward's account of the industries of Kioto. "Under the city government of Kioto there is an industrial department, the Kuwangiyoba, which was established in 1870 specially for the promotion of the industrial arts, and which has the following branches:—1. An experimental gardening department (Saibaishi

Kenjo), commenced in 1872, for the cultivation of foreign and Japanese fruits and vegetables; 2. A shoe-manufactory (Seikuwajo), begun at the same time, for extending the manufacture of boots and shoes of European style; 3. A weaving-factory (Shokkoba), begun in 1873, where silks and other fabrics are woven, principally in foreign looms: this branch sent three workmen to Europe to learn the art of foreign weaving; 4. A physical and chemical branch (Semikiyoku), which has a sub-branch at Miyadju, in Tango, eighty miles distant, and which, with the assistance of two foreign workmen, is promoting and teaching the manufacture of chemicals, soap, effervescing and lemon drinks, *cloisonné* ware, porcelain, &c.; adjoining it is the Senkojo, for teaching dyeing on foreign methods; 5. The female industrial school, Jokoba, already mentioned; 6. The Bokujo, or more properly Bokuchikujo, which is an experimental farm, established in 1871 with the object of improving the breeding of cattle and of teaching agriculture, the foreign cattle and sheep being chiefly purchased in America, and the milk produced being sold in the city; a branch farm exists at Komo in Tamba, about sixteen miles from Kioto; 7. A department (Yosanba) for promoting the multiplication of silkworms; 8. A pauper industrial department (Jusansho), established in 1869, with a branch at Dosembo, in the south-eastern part of Kioto County, where agriculture and the manufacture of earthenware are the principal employments of the pauper colony; 9. A street-sweeping department (Kuwakaisho), where compost is prepared on the French method; 10. A paper-manufactory, established in 1875. There exist also separate branches for making and teaching how to prepare leather, beer, and mineral waters. A museum is in course of formation."

Of course the educational establishments of the country interested Sir Edward greatly. We have heard much of the admirable university of Tokio and its famous engineering school. But all over the country, at least so much of it as Sir Edward Reed visited, Government is evidently doing what it can to give facilities for education of the best kind. Schools of all grades and for all classes and both sexes are being everywhere established, and some of those Sir Edward visited seemed to be admirably organised, though some of the subjects taught, especially to girls, are amusing. We all know what a hold science has taken upon the Japanese ever since they opened their country to European and American influence. They have been shrewd enough to see that through the encouragement of science lies the surest road to national progress, and the Government has spared no pains nor expense to place education in science in the first rank; and this feature is seen throughout all their schools. The present purpose of the Government is evidently to make education universal all over the country, and to bring it up to a standard equal to that of the foremost countries in Europe. Every soldier Sir Edward Reed noticed in the barracks at Osaka had a little library of books all to himself, and this is a relic of the old days of Japan, when the *samurai* class were at once the soldiers and scholars of the country. Sir Edward is sanguine enough to hope that the time may come in this country when soldiers will occupy a comparatively high position in the social scale, "and when the army will attract to it the surplus members of the civil community of all grades that are respectable and well instructed." Sir Edward was, moreover, struck with the size of the men in various parts of the country, as contrasted with the little fellows that are sent over here to be educated, and with the common idea entertained in Europe of the stature of Japanese. Indeed Sir Edward's testimony on this point is so novel and so different from that which has been generally accepted, that we should like to see some attention given to the subject by those in a position to throw light upon it. Sir Edward met at Kioto Mr. Akamatz, a highly-educated Buddhist priest, who had been to Europe to study and report on the

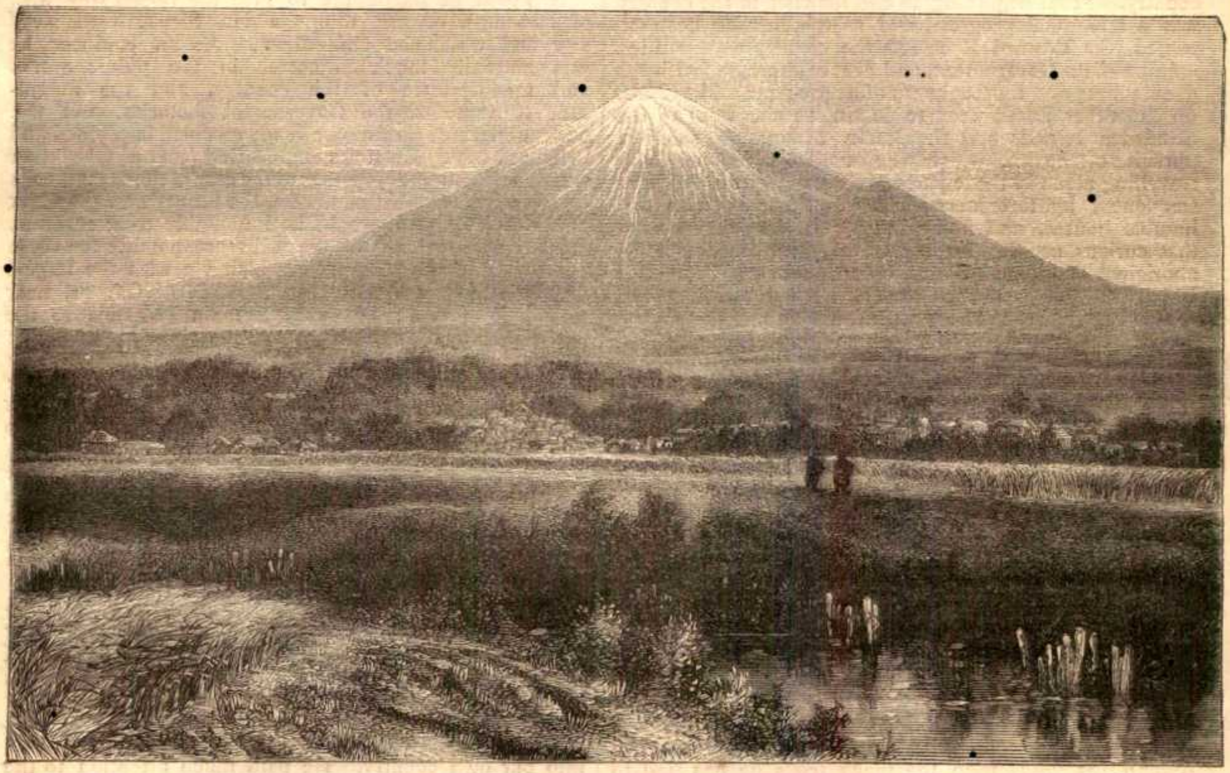


FIG. 1.—Mount Fuji.

religions of the West, and who spoke English well. "It may be interesting," Sir Edward says, "to some of my readers to learn that this excellent priest, possessing a knowledge of England and the English, and also the chief priest who was our host on this occasion, find embraced in their section of the Buddhist faith all that they consider good and true in the Christian religion, and are not without hope of seeing England adopt this view, and with it the tenets and practice of their faith, which they consider most excellent. It will be gratifying, doubtless, to the many good people at home who look upon Buddhists as eligible for conversion to their particular views of the Christian religion (whatever they may happen to be in each case), to find their own generous and beneficent intentions so entirely reciprocated."

Over Sir Edward, as over others who have been to Japan, the quiescent (not necessarily extinct) volcano, Fuji-yama, seems to have exercised an influence akin to fascination. He was never tired of looking at the snow-covered cone, rising nearly 13,000 feet above the sea in solitary grandeur, and like no other mountain in the world. For hundreds of miles around it is the prominent feature in the landscape, and the first object that meets the traveller's sight coming from south or east. "But the best evidence of the sacred character of Fuji is to be found, I think, in the fact that every person who speaks or writes about it seems naturally to rise more or less into a reverent state of feeling as he does so. It has a real, a strong, and a solemnising influence on all who behold it. Even when it is viewed from beyond other mountains, its sovereign character is very striking; and when it is seen springing with one tremendous and sublime flight from sea to sky, it is of more sovereign character still."

But the record of what Sir Edward Reed saw while he was in Japan forms a comparatively small part of the two volumes he has written. His interest in the country and its people is so great that he has put himself to considerable trouble to master their history, their religions, their political and social systems, their art and manufactures, in short everything that could enable him to understand a civilisation so real, but so entirely different from anything in Europe. The results of all this study, with the conclusions he has come to both from this and from his visit to the country, occupy a considerable part of the work. That a man of the scientific eminence and political experience of Sir Edward Reed should take so much interest in Japan seems to us a proof that it really deserves the attention of all thoughtful men; and whatever conclusions such an observer may come to ought to have considerable weight with those who are not quite sure what to think of the strange social and political phenomenon that has been taking place for upwards of ten years in the farthest East. Unless, however, the subject is approached in the spirit with which Sir Edward Reed has taken it up, a spirit of thorough seriousness, with an adequate idea of the worthiness of the subject for earnest inquiry, it had better be left alone. A little learning here is a dangerous thing, and has led some triflers to find only amusement in Japanese history and Japanese ways, as if this were merely a toy civilisation, and not a complicated system which has been the development of ages. Sir Edward traces, in his first volume, the history of the Japanese from the earliest "God-period" down to the present time; discusses their two great religions, the native Shintoism and imported Buddhism, their political and social system, their foreign relations, the recent reforms, and the existing government. In the second volume, besides the narrative of his journey, he has interesting chapters on art and on the proverbs and phrases of the people; and both in the second volume and in the introduction he has elaborate

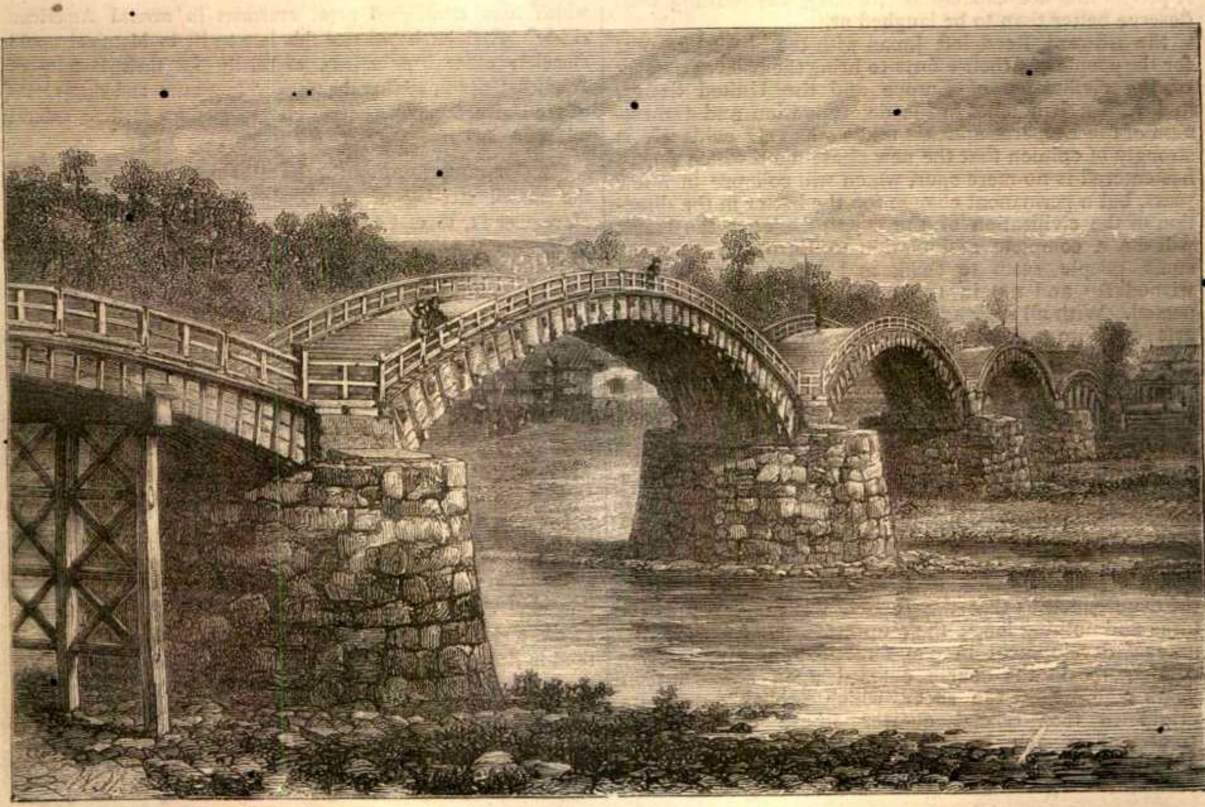

FIG. 2.—Curious Japanese Bridge.

discussions on the ethnology of the Japanese, their language and literature. Sir Edward does not profess to know all these subjects at first hand, but has, with perhaps only one exception, chosen for his guidance the most trustworthy authorities attainable. Sir Edward gives several examples of what the Japanese language is capable of in the way of poetry; we have space for only one specimen:—

> "Types of our children are the tiny grasses,
> Tender and fragile in the ample moorland:
> We know not to what fragrance their infant sprouts may blossom,
> Nor wist to what sweetness their unborn fruits may ripen,
> But hoping ever wait till autumn tells their story.
> Oh! cherished children, may ye never perish,
> Flowerless, fruitless, in the early springtime,
> Nor like this petal trampled by the wayside,
> Fall in the fuller promise of your prime."

A people that are capable of thinking and writing thus deserve better than to be laughed at.

Sir Edward Reed left Japan with the highest respect for the people and their efforts to bring themselves abreast of the civilisation of Europe and the United States, and with a firm belief in the determination and earnestness of the Emperor and his ministers. He evidently is strongly of opinion that the new phase upon which Japan has entered is no mere spurt which will collapse in a few years, but a permanent change for the better in the direction of the civilisation of the country. That the result will be a complete assimilation to European ways, as some people seem to think and hope, is not to be wished for and not in the nature of things to be expected. With all their admiration for the science and the arts of Europe, the Japanese respect themselves sufficiently to see that there is much in their old civilisation that may well be retained. Indeed the problem is one of the meeting of two forces. A new force from an entirely different direction has struck in upon the course of the old civilisation, with the result of a permanent change of direction; but that change cannot be entirely in the direction of the new force. Nor will the final result be a lapse back into the old ways; even in the brief period since the country was opened to European influence the change has been so wide and deep that any such lapse is inconceivable. Those who are in the habit of decrying the country tell us that the Japanese are everything by turns and nothing long; their upwards of 2,000 years of gradual development in one direction, and their steady continuance in the course entered upon about fifteen years ago, belies the sneer, which probably owes its origin to that official quarter whose contemptuous treatment of the Japanese Government Sir Edward Reed so strongly laments. We earnestly hope that the Japanese will go on during the next fifteen years as they have done in the past, and by that time the current in the new channel will be so broad and powerful that it will require a force of equal power to seriously change its direction, and we do not know where that is to come from. The problem in national development being worked out by the Japanese is of the highest possible interest, and what is its real nature cannot be better learned than from the two valuable volumes which so busy a man as Sir Edward Reed has found time to put together.[1]

NOTES

THE foundation-stone of the new museum of McGill College, Montreal, to which we referred some time ago, was laid on September 21 by the Marquis of Lorne. Principal Dawson in thanking Mr. Redpath, the donor, for his generous gift, stated that the museum would be not merely a place for the exhibition of specimens, but a teaching instrument and a laboratory of original research; a great natural science department of the University, in which the classes in geology and biology would receive their instruction, original workers would be trained in all departments of natural science, and from which would go forth the men—and, he trusted, the women also—best fitted to bring to light the hidden treasures of the Dominion, and to avert by the aid of science the injuries with which any of its industries might be threatened. Dr. Dawson referred to other noble examples of private local or national liberality on the American continent, besides those of which Montreal can boast—to "the great National Museum at Washington, which is intended to rival, and if possible surpass, the British Museum; the Central Park Museum of New York, on which that great city has lavished vast sums of money; the Zoological Museum of Harvard, whose revenues would suffice to support some entire universities in this country; or the foundations of Mr. Peabody, which have established great museums in several American cities." And he hoped that this latest gift to Montreal would stimulate other benefactions, especially for their Faculty of Applied Science, so that the physical apparatus and class-rooms of the University might be as well provided for as their natural science collections.

MR. MERRIFIELD, F.R.S., the retiring president, proposes at the annual meeting of the London Mathematical Society on November 11, to cast his valedictory address into the form of "Considerations respecting the Translation of Series of Observations into Continuous Formulæ." The following is the proposed new Council:—Mr. S. Roberts, F.R.S., president; Dr. Hirst, F.R.S., and Mr. J. W. L. Glaisher, F.R.S., vice-presidents; Mr. C. W. Merrifield, F.R.S., treasurer; Messrs. M. Jenkins and R. Tucker, honorary secretaries; other members, Prof. Cayley, F.R.S., Mr. H. Hart, Prof. Henrici, F.R.S., Dr. Hopkinson, F.R.S., Mr. A. B. Kempe, Mr. R. F. Scott, Prof. H. J. S. Smith, F.R.S., Messrs. Lloyd Tanner, H. M. Taylor, and J. J. Walker.

WE take the following from the New York "Monthly Index to Current Periodical Literature," &c.:—"The new Warner Observatory which is being erected at Rochester, N.Y., is attracting much attention in social and literary as well as scientific circles. The new telescope will be twenty-two feet in length, and its lens sixteen inches in diameter, thus making it third in size of any instrument heretofore manufactured, while the dome of the Observatory is to have some new appliances for specially observing certain portions of the heavens. It is to be the finest private observatory in the world, and has been heavily endowed by Mr. H. H. Warner. Prof. Swift has laboured under numerous disadvantages in the past, and the new comet which he recently found was in spite of many obstacles; but as the new institution is to be specially devoted to discoveries, there are good reasons to expect very many scientific revelations in the near future from the Warner Observatory at Rochester."

THE *Times* has shown considerable pluck in having erected at its office one of Mr. Jordan's glycerine barometers, described in NATURE, vol. xxi. p. 377. In the issue of the 25th inst. and following days are published the readings of this gigantic barometer at intervals of two hours from 2 p.m. to 2 a.m. This will be continued regularly, a second edition of the paper giving the two-hourly readings from midnight to noon. These daily records with a barometer on such an enormous scale will be of the greatest value. The *Times* rightly states that it seems unquestionable that an instrument of this kind is admirably suited for practical use at meteorological stations, at seaports, in collieries, and in all other situations where it is of importance for the unpractised eye to notice frequently and easily the changes taking place in atmospheric pressure.

THE results of the observations made from the two balloons sent up from the Crystal Palace on Thursday last have not yet been discussed. But it may be stated that the direction of the wind was remarkably steady, as during the run the two balloons were constantly kept in view of each other in spite of the want of light and transparency of air. This result is all the more to be noted that the variations in the altitude of the two balloons were frequent and considerable, 0 to 5000 feet. The variation of temperature did not amount to more than 5° C. between the maximum of the readings and their minimum. A peculiar current was observed just on arriving on the coast, which is usual under such circumstances. The composition of the clouds was very complex. First, a layer of transparent fog covered almost the whole of the land and gave a watery appearance to it; second, cumuli described as analogous to pulled bread were floating at a height of 1000 metres and descended gradually as the sun was nearing to the horizon; and lastly, a large number of parallel strati stretching south-westerly in the direction of the sun, and seemingly diverging from it. The velocity of the wind was about half a mile per minute, and pretty well determined by observers located in one of the two towers of the Crystal Palace. As to the prognostication of the route, it was nicely done by Mr. Coxwell, who told M. de Fonvielle that he should land between Portsmouth and Winchester. A question arose between M. de Fonvielle and Commander Cheyne about the bearing, the latter's compass having been reversed by an optical illusion, but the azimuth was given with great accuracy, and the uncertainty between the two would not have lasted for a minute if the possibility of the error could have been ascertained. The swinging of the balloon round its axis was sufficient to prevent the use of a new compass designed on purpose for aëronauts.

IT has been represented to us that in our notice of Prof. Owen's work the statement that "he was lecturer on palæontology at the School of Mines in Jermyn Street in 1856" may lead to a misapprehension. We have therefore to state that although Prof. Owen delivered a course of lectures in the theatre of the School of Mines in the year in question, he held no appointment in that institution.

MR. GRAHAM BELL has been honoured in the scientific, as well as other circles of Paris during the past week. He exhibited his photophone at the establishment of M. Antoine Breguet and elsewhere, and was the object of much curiosity wherever he went as "l'homme qui fait parler la lumière."

AT the opening meeting of the Geologists' Association on November 5, the president, Prof. Rupert Jones, will read a paper on the origin and progress of that society.

THE next number of the Victoria Philosophical Institute's *Journal* is announced to contain papers by Prof. Stokes, F.R.S., Prof. Hughes of Cambridge, Prof. Nicholson, M.D., F.R.S.E.; of St. Andrew's, and Dr. Hormuzd Rassam, with maps and details of his discoveries.

MR. FLETCHER of Warrington has sent us a specimen of a new gas-heating burner which seems well adapted for many purposes and trades which are as yet unsupplied with satisfactory heating apparatus. It seems to us to have all the advantages claimed for it by Mr. Fletcher. It has from three to four times the power of any burner similar in appearance; the flame is *solid*, intensely hot, and perfectly free from smell; it gives a duty higher than the calculated theoretical maximum for the gas consumed, and it cannot be damaged by the dirtiest work. In case the perforated copper dome gets choked with dirt, it can when the burner is warm be lifted off and washed or brushed clean. Any liquid spilt so as to get inside the burner flows out by the side tube without the possibility of damaging the burner. The body of the burner is cast all in one piece, without a joint, thus doing away with one great fault, causing liability to leakage in most of the burners at present in use. Altogether this burner seems to be one of the greatest advances yet made in the practice of heating by gas. Mr. Fletcher has also sent us a useful practical paper on Heating (including cooking) by Gas, read the other day before the Philosophical Society of Glasgow.

PART iii. is to hand of the magnificent "Bedfordshire Pomona," the illustrations of the apples and pears in which continue to be as numerous and life-like as ever, so much so as to make one's mouth water. The papers in this part are on "The Crab, its Characteristics and Associations," by Mr. Edwin Lees, F.L.S.; "The Orchard, its Products: Cider and Perry," by the Rev. C. H. Bulmer; the latter a paper of considerable length, minute detail, and great practical value. Mr. David Bogue is the London publisher.

AMONG the lectures to be given this winter at the Museum and Library, Queen's Road, Bristol, are the following:—November 22, Prof. S. P. Thompson, B.A., D.Sc., "The Rainbow," illustrated with experiments by the electric light; January 17, 1881, Prof. Rolleston, M.A., M.D., F.R.S., F.L.S., Linacre Professor of Anatomy and Physiology, Oxford, "The Early Races of the British Isles"; January 31, Sir John Lubbock, Bart., M.P., F.R.S., F.L.S., "Fruit and Seeds"; February 14, Rev. J. M. Wilson, M.A., F.R.A.S., Head Master of Clifton College, "Double and Multiple Stars"; February 28, Dr. W. H. Stone, F.R.C.S., Lecturer on Physics at St. Thomas's Hospital, "The Measurement and Determination of Musical Pitch," illustrated with experiments; March 14, Prof. W. J. Sollas, M.A., F.R.S.E., F.G.S., Curator of the Bristol Museum, "Coal and the Bristol Coalfields."

WE have received the Catalogue of the General Lending Department of the Newcastle-on-Tyne Public Library, a very thick volume, with a much thinner one containing a list of the books of the Juvenile Lending Department. We may notice them more at length in a future number.

WE have received a very favourable Sixth Annual Report from the West London Scientific Association and Field Club, which commenced its new session on the second Tuesday of this month.

THE *Reports* of the Dunedin (N.Z.) Naturalists' Field Club for 1878-80 are, we regret to see, desponding. It finds some difficulty in keeping up the interest of its members, rather a strange thing in the land of the New Zealand Institute. The Report contains catalogues of the indigenous and introduced flowering plants occurring in the Dunedin district.

ON September 23 Rangoon was visited by three distinct shocks of earthquake; all parts of the province had previously been visited by shocks. A shock of earthquake lasting two seconds was felt at Cordova on the 21st inst., accompanied by a loud subterraneous rumbling. A slight shock, lasting six seconds, was also felt at Madrid on the same day. The shock was stronger in the centre of the city than in the outskirts, and shocks occurred in several towns of the province of Zamora, but no damage has been done. On the same date a shock, the after effects of which were felt in almost every part of the country, occurred both at Lisbon and Coimbra, without however doing any damage.

IT is stated that at the National Exhibition to be opened at Milan next year there will be a captive balloon, on the model of the one which was so successful in Paris in 1878. It will measure not less than 180 feet in circumference, 84 feet in height, and contain 15,000 cubic feet of gas. To it will be attached a safe and solid car, capable of containing seats for at least eight persons. A steam-engine is to regulate the ascent and descent, and it will rise to a height of about 900 feet, affording a splendid view of Milan and the plains of Lombardy. The balloon will be constructed at Milan, M. Henri Beudet, the well-known and experienced aëronaut, having been sent for to direct the work.

THE coal-beds on the Souris River, Manitoba, have proved very rich, and are to be developed during the winter.

THE Japan papers call attention to the almost limitless mineral wealth lying dormant in the country, and which is only waiting for development to become a profitable source of revenue. Of coal there is an abundant supply, but only the Takashima mine has been fitted with modern appliances. There are several other coal mines which are only unprofitable because improperly worked, and now it is averred that Prof. Atkinson during a sojourn in the Mitake Mountains of the Koshu Province has discovered another valuable deposit of coal.

MR. NORTH, who was sent by the Natal Government to examine the Newcastle coal-fields, has reported favourably on the quantity and quality of the coal.

ON Friday evening, October 22, previous to distributing at the Manchester Mechanics' Institute the prizes and certificates gained by the students at this year's Science and Arts, Society of Arts, City and Guilds of London Institute, and Union of Lancashire and Cheshire Institute's examinations, Prof. Ayrton delivered an address on Technical Education and on the future of Mechanics' Institutions. Of the two original objects for which Mechanics' Institutions were established fifty years ago, to provide clubs for artisans and places for giving popular scientific lectures, it was shown that the latter had to a great extent been abandoned; also that the mere novel utility of such institutions in furnishing the means for the holding of science and art classes would also be taken away from them when the teaching of elementary science became the duty of our elementary schools. There remained, however, for Mechanics' Institutions a great new field of activity in the teaching of applied science to mechanics, not the teaching of abstract scientific principles and the applications only perhaps afterwards, but the teaching of these scientific principles *through* the apparatus in use in daily life; in fact, that Mechanics' Institutions could well furnish the machinery by means of which numerous technical classes throughout the country which were so much needed could be rapidly established, the money voted by the City and Guilds of London Institute as payment on the results of the technological examinations, together with funds locally subscribed, furnishing the motive power. What the lecturer thought technical teaching should consist of was illustrated by the kind of work now going on at the temporary laboratories of the City Guilds Institute at Finsbury; stress was laid on the fact that there were no distinct students' fees there for laboratory work and for lectures, but that every fee, small as it was, entitled each student to at least two hours' practical work in the laboratories for every one hour of lecture; so that in fact all the 150 students had laboratory work which did not consist in the mere repetition of qualitative lecture experiments, but in the making of accurate quantitative measurements, all bearing as far as possible directly on each student's trade. Of this practical illustrations were given. Prof. Ayrton concluded by warning technical instructors from attempting to follow ordinary college methods of *synthetical* teaching, which, although most valuable for a young lad prepared to spend several years at college, was quite unsuitable for an artisan engaged all day in following his trade. Technical education, he considered, must be distinctly *analytical*—the complete machine as the artisan knew it must be taken at once, and the science developed, so to say, from the machine itself; and that it was men with a good practical knowledge of their trade and with an aptitude for science rather than men versed in science, but with only a mere book knowledge of industries, that were wanted both as candidates for the technological examinations and as students to be trained up as technical instructors.

IN the note on the late Dr. Sparks in NATURE, vol. xxii. p. 591, for Dr. King's "Therapeutics", read Dr. Binz's "Therapeutics."

THE additions to the Zoological Society's Gardens during the past fortnight include a Macaque Monkey (*Macacus cynomolgus*) from India, presented by Mr. W. B. Tustin; two Polar Bears (*Ursus maritimus*), an Ivory Gull (*Larus eburneus*) from the Arctic Regions, presented by Mr. Leigh Smith, F.Z.S.; a Crested Porcupine (*Hystrix cristata*) from India, presented by Mr. W. Middleton; three Gaimard's Rat Kangaroos (*Hypsiprymnus gaimardi*) from Australia, presented by Mr. A. B. Gow; a — Brocket (*Cariacus sp. inc.*), a White-bellied Opossum (*Didelphys albiventris*), a Brazilian Hare (*Lepus brasiliensis*) from Quipapà, Pernambuco, a White-bellied Guan (*Ortalida albiventris*), a Black Tortoise (*Testudo carbonaria*) from Garanhuns, presented by Mr. W. A. Forbes, F.Z.S.; a Frigate Bird (*Fregata aquila*) from Fernando de Noronha, presented by the Rev. G. Bayldon; a Yellow-headed Conure (*Conurus jendaya*) from Pernambuco, presented by Mr. C. A. Craven; two American Black-backed Geese (*Sarcidiornis carunculata*) from the Sertoes of Pernambuco, presented by Miss Davis; a White-throated Finch (*Spermophila albogularis*) from Pernambuco, presented by Mr. S. Jones; a Herring Gull (*Larus argentatus*), British, presented by Mr. J. Palmer; a Horrid Rattlesnake (*Crotalus horridus*) from Quipapà, Pernambuco, presented by Mr. H. E. Weaver; a Bonnet Monkey (*Macacus radiatus*) from India, a Black Iguana (*Metopoceros cornutum*) from Galapagos (?), deposited; a Rock Cavy (*Ceredon rupestris*), a Green-winged Trumpeter (*Psophia viridis*), a White-bellied Parrot (*Caica leucogaster*), a Red-vented Parrot (*Pionus menstruus*), two Golden-headed Parrakeets (*Brotogerys tui*), two Toco Toucans (*Ramphastos toco*), an Orinoco Goose (*Chenalopex jubata*) from Brazil, a Rufous Pigeon (*Columba rufina*), a Yarrell's Siskin (*Chrysomitris yarrelli*), two Scaly Doves (*Scardafella squamosa*) from Parahyba, three Picazuro Pigeons (*Columba picazuro*), a Black Tanager (*Tachyphonus melaleucus*), a Black-headed Tanager (*Orchesticus ater*), a Passerine Ground Dove (*Chamæpelia passerina*), three Yellow-shouldered Hangnest (*Icterus tibialis*), from Pernambuco, a Brazilian Tanager (*Ramphocœlus brasilius*), a Blue and Black Tanager (*Calliste brasiliensis*) from Bahia, a White-eyebrowed Guan (*Penelope superciliaris*) from Panellas, four Cactus Conures (*Conurus cactorum*), two Banded Tinamous (*Crypturus noctivagus*), seven Tataupa Tinamous (*Crypturus tataupa*) from Garanhuns, a Great-Billed Rhea (*Rhea macrorhyncha*) from Agoas Bellas, Pernambuco, two Orchard Hangnests (*Icterus spurius*), a Baltimore Hangnest (*Icterus baltimore*) from North America, purchased; two Squirrel-like Phalangers (*Belideus sciureus*), born in the Gardens; a Macaque Monkey (*Macacus cynomolgus*) from India, presented by Mr. F. W. Manley; a Dunlin (*Tringa cinclus*), a Sanderling (*Calidris arenaria*), British, presented by Mr. Edmund Elliot, M.R.C.S.; a Horned Lizard (*Phrynosoma cornutum*) from Texas, presented by Mr. W. C. Boyd; a Waxwing (*Ampelis garrulus*), European, deposited; a Black Saki (*Pithecia satanas*) from Lower Amazons, a Roseate Spoonbill (*Platalea ajaja*), a Great-billed Rhea (*Rhea macrorhyncha*) from South America, purchased.

OUR ASTRONOMICAL COLUMN

CERASKI'S VARIABLE OF SHORT PERIOD.—It will be seen from a letter which Prof. Pickering, the Director of the Observatory of Harvard College has addressed to us, that, contrary to the opinion expressed by Dr. Julius Schmidt from his earlier observations, the true period of this notable variable star, instead of being a little less than five days, appears to be a little less than half this interval, otherwise *minima* observed at Harvard College, will not accord with those of May and August observed in Europe.

It is probable that Schwerd observed the star near a *maximum* at meridian transit at Speyer on March 11, 1828, when he estimated its magnitude 6·7, and near a *minimum* at transit on May 12 in the same year, when he rated it only 10m. If we compare the observation of March 11 with that of Dr. Schmidt, who fixed a *minimum* to August 12 at 6h. mean time at Athens, and assume 7662 periods to be included in the interval, we get for the duration of one period 2·49084d., or 2d. 11h. 46·81m., which closely accords with half the period assigned by Schmidt from his own observations and those of Ceraski. This reckoning from August 12·1841 Greenwich mean time, and correcting for the light-equation, will give the following times of geocentric minima observable in this country:—

	h. m.			h. m.	
Oct. 28 ...	9 33	G.M.T.	Nov. 17 ...	7 47	G.M.T.
Nov. 2 ...	9 7	,,	22 ...	7 21	,,
7 ...	8 40	,,	27 ...	6 54	,,
12 ...	8 14	,,	Dec. 2 ...	6 28	,,

And for the times of visible maxima, supposing this phase to occur midway between the minima, we find—

	h. m.			h. m.	
Oct. 29 ...	15 27	G.M.T.	Nov. 18 ...	13 40	G.M.T.
Nov. 3 ...	15 0	,,	23 ...	13 14	,,
8 ...	14 33	,,	28 ...	12 48	,,
13 ...	14 7	,,	Dec. 3 ...	12 21	,,

If S be the sun's longitude, and R the earth's radius-vector, the correction for the light-equation (geocentric—heliocentric) for 1880 may be found from

$$\text{Cor.} = 224{\cdot}0\text{s}\ R.\ \sin\,(S + 19^\circ\ 17'{\cdot}4).$$

We have received from Lord Lindsay a circular containing the same information that is given in Prof. Pickering's letter, with the addition of a diagram showing the *Durchmusterung* stars in the vicinity of the variable, which for 1881·0 has R.A. 0h. 51m. 48s., N.P.D. 8° 46′·0.

[Mr. Knott's observation on October 23, received since the above was in type, as compared with Athens, August 12, seems to require a somewhat longer period, with minima a half hour or so later than we have computed.]

THE ROTATION OF JUPITER.—In No. 2,342 of the *Astronomische Nachrichten* (to which we refer for numerical details) Dr. Julius Schmidt has a communication wherein he finds, from observations of the red spot upon the disk of Jupiter by himself and others in 1879–80, an interval of 9h. 55m. 34·4s. for the time of the planet's rotation upon its axis, a result that he considers may be adopted until the observations generally have attained a greater degree of precision than they appear to possess at present. With due care and practice, however, he believes that such observations will be found to admit of much greater accuracy, and illustrates this by his own experience at Athens in the present year. In the same communication he also discusses observations of a dark oval spot (a more favourable object than any used by Airy and Mädler) during 104 rotations in 1862; these observations give 9h. 55m. 25·68s. for the period of rotation, a result closely agreeing with those of 1834–35.

CHEMICAL NOTES

A NEW method of preparing acetylene is described by Dr. W. Suida in *Wien. Akad. Ber.* The method consists in heating iodoform and mercury ethide in sealed tubes to 120°; the products of the reaction are acetylene, ethylene, ethylic iodide, and mercury ethyliodide.

THE same *Berichte* contains a paper by Herr v. Dumreicher on the relative stabilities of nitrous and nitric oxides, and of nitrous and nitric oxides when acted on stannous chloride. Nitrous oxide is not reduced even at 100°; nitrous acid is reduced to nitrous oxide; nitric oxide and nitric acid are reduced to hydroxylamine, and subsequently to ammonia. The reaction may be applied to the estimation of nitric acid.

IN the *Proceedings* of the Academy of Rome Signor Cossa communicates the results of experiments on didymium tungstate: he has determined the specific heat of this salt to be 0·0831—temperaturature limits are not given. Taking the atomic heat of tungsten as 6·4, and that of oxgen as 4, this result points rather to the formula for didymium tungstate, $DiWO_4(Di = 98)$, than to that now generally accepted, $Di_2(WO_4)_3(Di = 147)$.

A NEW organo-metallic compound containing the divalent radicle $(CH_2)''$ is described in the *Journal* of the Chemical Society by Sakurai; the formula of the new substance, for which the name *Monomercuric methylene iodide* is proposed is $I(CH_2)HgI$. This is the first known metallic compound containing a *divalent* hydrocarbon radicle.

G. BOUCHARDAT claims, in *Compt. rend.*, to have converted amylene, by successive removals of hydrogen, into cymene. Hitherto attempts to pass, by a simple series of reactions, similar to those by which the passage from one isologous group to another is effected, from the paraffin to the aromatic group of compounds, have not been successful.

ACCORDING to the experiments of Macagno (*Bied. Centralbatt*) the mellowness of old wine is due more to an increase in the amount of glycerine present, than to a decrease in the tannin; there must also be a certain proportion between the amounts of alcohol and tannin, in order that the wine may keep well.

IN the *Annales Chim. Phys.* Berthelot describes an apparatus in which the combination of two gaseous constituents to form a gaseous compound may be conducted, so as to allow of an accurate measurement of the thermal change which accompanies the chemical change.

A DISCUSSION as to the value to be assigned to the atomic weight of antimony is at present being carried on. From analyses of the bromide and other salts, Prof. Cooke of Harvard concludes that the generally-accepted number, 122, is too large, and that 120 is more nearly correct. Herr Schneider, whose experiments had been criticised by Cooke, replies in the *Journal für Pract. Chem.* He sharply criticises Cooke's methods, gives the details of new experiments, and asserts strongly that 122 is much more nearly correct than 120.

NO results of special importance have lately been published regarding the densities of the vapours of the halogen elements. An objection made by Pettersson and Ekstrand to V. Meyer's method, viz. that solid bodies condense air on their surface, which air they again give up when strongly heated, has been shown by Meyer, in the last number of the Berlin *Berichte*, to have no weight against his experiments.

TWO important papers on atmospheric ozone have been published in the *Berichte* by E. Schöne. This observer, who has given much careful study to the subject of ozone, says that the smell of ozonised oxygen does not at all resemble the peculiar odour noticed after a lightning flash. The true smell of ozone is, however, frequently noticeable in ordinary air, and coming from the clothes of persons who may enter a room from the open air in winter. The ordinary potassium iodine papers are valueless as ozone measurers, according to Schöne. A small amount of ozone in moist air produces a greater depth of colour on these papers than a larger amount of ozone in dry air. The *humidity of the air* and the hygroscopic character of the material from which the paper is made therefore largely influence the depth of colour produced. It has been supposed that much ozone is produced in the neighbourhood of waterfalls, but the increased depth of colour of the potassium iodide papers is only due, says Schöne, to the great humidity of the air. Schönbein's "ozonometer" serves as a very rough hygrometer. Paper coated with thallous hydrate is recommended as a measurer of the relative amount of "oxidising principle" in the air: the paper is coloured brown—owing to production of thallic oxide—by ozone or hydrogen peroxide. A table is given showing the variations in "oxidising principle" during 1879. The general conclusions are briefly these:—1. The papers are coloured more deeply during the day than during the night; this difference is more apparent during the long days of the year. 2. Increased wind-force causes increased coloration, because a greater amount of oxidising substance is brought in contact with the paper during the time of exposure. 3. Cloudiness and rain especially influence the coloration; the heavier the rain the smaller the coloration of the paper. Direct determinations of hydrogen peroxide have shown that when the thallium papers are much coloured this compound is present in the atmosphere in comparatively large quantity. Herr Schöne regards the actual existence of ozone in the atmosphere as at present an open question.

MR. A. VILLIERS publishes in the September number of *Annales Chim. Phys.* a lengthy and important paper on the conditions of equilibrium of mixtures of alcohols and mineral acids. He considers in detail the velocity, and limits of etherification of the more important mineral acids, and arrives at many valuable results.

GEOGRAPHICAL NOTES

AT the last meeting of the Berlin Geographical Society news was received through a German trade house in Tangier that Dr. Lenz had reached Timbuctoo, and that he hoped to be at St. Louis, in Senegal, in the month of July. If this is correct Dr. Lenz has made a rapid journey in this direction, as he only left Tangier on December 22 last. Caillé, however, in 1828, travelled from Timbuctoo to Fez in four months. The last letter received from him by the Society was from Tenduf, in the beginning of May, twenty days' journey from Timbuctoo.

THE *Zeitschrift* of the Berlin Geographical Society, Nos. 88, 89, has a valuable map by Herr Richard Kiepert, showing the work done in Angola in 1876 by Dr. H. von Barth in the region of the Bengo and Lucalla, and of Herr Otto Schütt in 1877-79 on the Lower Quanza. Dr. von Möllendorff discusses the methods of transcribing Chinese geographical names, and concludes that the Pekin form of the Guan-hua, or so-called Mandarin dialect, would be best for general purposes. But Dr. von Möllendorff asks whether, while selecting this form generally, it is advisable to make exceptions in certain cases. Such names, for example, as already exist in familiar forms might be excepted, as Pekin, Canton, Hongkong, Swatow, &c. With other names, especially for special maps, a change from the uniform method of writing might be adopted. Maps of districts for the use of travellers would evidently be of greatest service when the local forms of names were given. Perhaps the Guan-hua might be used for the names of great towns, large rivers, and mountains, while smaller places might have the local forms of their names. For a map of the whole of China, or of the greater part of it, containing little more than the district towns, evidently the Guan-hua would be the preferable form. In books it would perhaps be best to give both forms. It is, no doubt, high time that some attempt at uniformity should be made, but the difficulty is by no means easy of solution, owing partly to the letters of the alphabet not being sounded uniformly in all European languages. Herr von Möllendorff instances the absurdity of the present want of system by the ways in which the Chinese name of the Yellow River is spelled. These are confusing enough, but what will he say when he sees "Houan Hé" (for Hwang-ho) at the head of the interesting communication just received from Col. Prejevalsky? We cannot entirely concur in Herr von Möllendorff's definition of "Kwan-hwa," popularly translated "Mandarin dialect," and he himself makes the orthographical jumble much worse by writing "Guan-hua," which we should imagine few sinologues would attempt to defend. The vexed question, however, may find a solution before long in an unexpected quarter, for the Statistical Department of the Chinese Maritime Customs at Shanghai, we believe, have under consideration a system of spelling for adoption in their reports and other publications, and this, if adopted, will probably come by degrees into general use. Dr. Hildebrandt gives an account of a visit he made to the Amber Mountains in the north of Madagascar; Herr K. Himy continues his elaborate paper on the region around the Kara-Kul, and much of the number is occupied with the journal in North Africa of the late Dr. Erwin von Bary.

THE new number of the Lyons Geographical Society's *Bulletin* contains several items of interest. M. Morice's paper on French Cochin-China is published with a sketch map, followed by some notes by the Abbé Desgodins on the hydrography and orography of Tibet, and a communication by the Abbé Faure on Potosi in Bolivia. Among the other contents are Père Brucker's notes on the geographical positions in Eastern Turkistan and Jungaria determined in 1876 by two Jesuit missionaries, and the report on Col. Flatters' explorations in the Central Sahara last spring.

M. VENUIKOFF has just published at Geneva an historical sketch of the geographical discoveries made in Asiatic Russia from the most remote times to our own days, illustrated by Perthes' map of North and Central Asia.

THE China Inland Mission have been informed by Mr. Samuel Clarke, one of their agents in the Chinese province of Szechuen, that, in company with Mr. Mollman, of the British and Foreign Bible Society, he lately made a journey from Chungking, on the Upper Yangtsze-kiang, to Chêngtu-fu, the capital of the province, on which he travelled by unfrequented roads, where, so far as he could learn, no foreigner had ever been seen before; several previously unvisited towns were also entered. Mr. Clarke calls especial attention to the commercial activity prevailing along his route, and the frequency with which markets were held.

THE Asiatic Society of Bengal have just published, as an extra part of their *Journal*, a "Vocabulary of the Language of Eastern Turkistan," by the late Mr. R. B. Shaw, the well-known traveller, supplemented by two Turki vocabularies of birds and plants by Mr. J. Scully, lately on special duty at Kashgar.

FROM the Vienna *Allgemeine Zeitung* we gather that Dr. Emil Holub contemplates undertaking another lengthened journey in Central South Africa, provided that he can obtain the necessary funds. It is estimated that 50,000 florins will be required for the purpose, and it is proposed to raise this sum by a public subscription, the Austrian Geographical Society heading the list.

THE September number of the *Boletin* of the Madrid Geographical Society contains a detailed account of the Marquesas Islands, with map, by D. Ricardo Beltrán of Rózpide.

IT is stated that the *Gulnare*, with Capt. Howgate's expedition, landed at Rittenbank in Greenland, Dr. Pavy and Mr. Clay, whose intention is stated to be to make natural history collections and explore the northern limits of Greenland. This, we believe, is the same M. Pavy (a Frenchman) whose projected polar expedition suddenly collapsed in San Francisco seven years ago.

THE Austrian *Monatsschrift für den Orient* for October contains an article by Prof. Vambéry on the commercial importance of the Upper Oxus, in which he endeavours to show that there, and not on the Lower Oxus, is trade likely to be developed. Dr. Paulitschke gives an interesting sketch of the progress of African exploration during the past seventy years.

ON MAXIMUM AND MINIMUM ENERGY IN VORTEX MOTION[1]

I. A FINITE volume of incompressible inviscid fluid being given, in motion, filling a fixed, simply continuous, rigid boundary, the fact of its being in motion implies molecular rotation, or (as it may be called for brevity) vorticity. Helmholtz's law of conservation of vorticity shows that, whether the boundary be kept fixed as given, or be moved or deformed in any way, and brought back to its given shape and position, there remains in every portion of the fluid which had molecular rotation a definite constant of vorticity; and his formula for calculating energy for any given distribution of vorticity allows us to see that the energy may be varied by the supposed operation on the boundary.

II. The condition for steady motion of an incompressible inviscid fluid filling a finite fixed portion of space (that is to say motion in which the velocity and direction of motion continue unchanged at every point of the space within which the fluid is placed) is that, with given vorticity, the energy is a thorough maximum, or a thorough minimum, or a minimax. The farther condidition of *stability* is secured by the consideration of energy alone for any case of steady motion, for which the energy is a thorough maximum or a thorough minimum; because when the boundary is held fixed the energy is of necessity constant. But the mere consideration of energy does not decide the question of stability for any case of steady motion in which the energy is a minimax.

III. It is clear that, commencing with *any* given motion, the energy may be increased indefinitely by properly-designed operation on the boundary (understood that the primitive boundary is returned to). Hence, with given vorticity, there is no thorough maximum of energy in any case. There may also be *complete annulment* of the energy by operation on the boundary (with return to the primitive boundary), as we see by the following illustrations:—

1. The case of two equal, parallel, and oppositely rotating vortex columns terminated perpendicularly by two fixed parallel planes, which, by proper operation on the boundary, may be so

---

[1] By Sir William Thomson, British Association, Swansea, Section A, Saturday, August 28.

mixed (like two eggs "whipped" together) that, infinitely near to any portion of either, there shall be some of the other.

2. The case of a single Helmholtz ring, reduced by diminution of its aperture to an infinitely long tube coiled within the inclosure.

3. The case of a single vortex column, with two ends on the boundary, bent till its middle meets the boundary; and farther bent and extended, till it is broken into two equal and opposite vortex columns; and then farther dealt with till these two are whipped together to mutual annihilation.

IV. To avoid for the present the extremely difficult general question illustrated (or suggested) by the consideration of such cases, confine ourselves now to two-dimensional motions in a space bounded by two fixed parallel planes and a closed cylindric surface perpendicular to them, subjected to changes of figure (but always truly cylindric and perpendicular to the planes). It is obvious that, with the limitation to two-dimensional motion, the energy cannot be either infinitely small or infinitely great with any given vorticity and given cylindric figure. Hence, under the given conditions, there certainly are at least two stable steady motions. We shall, however, see further that possibly in every case except cases of a narrow, well-defined character, and certainly in many cases, there is an infinite number of stable steady motions.

V. In the present case, clearly, though there are an infinite number of unstable steady motions, there are only two stable steady motions—those of absolute maximum and of absolute minimum energy.

VI. In every steady motion, when the boundary is circular, the stream lines are concentric circles, and the fluid is distributed in co-axial cylindric layers of equal vorticity. In the stable motion of maximum energy, the vorticity is greatest at the axis of the cylinder, and is less and less outwards to the circumference. In the stable motion of minimum energy the vorticity is smallest at the axis, and greater and greater outwards to the circumference. To express the conditions symbolically, let T be the velocity of the fluid at distance r from the axis (understood that the direction of the motion is perpendicular to the direction of r); the vorticity at distance r is—

$$\tfrac{1}{2}\left(\frac{T}{r}+\frac{dT}{dr}\right).$$

If the value of this expression diminishes from $r = 0$ to $r = a$, the motion is stable, and of maximum energy. If it increases from $r = 0$ to $r = a$ the motion is stable and of minimum energy. If it increases and diminishes, or diminishes and increases, as r increases continuously, the motion is unstable.

VII. As a simplest subcase, let the vorticity be uniform through a given portion of the whole fluid, and zero through the remainder. In the stable motion of greatest energy, the portion of fluid having vorticity will be in the shape of a circular cylinder rotating like a solid round its own axis, coinciding with the axis of the inclosure; and the remainder of the fluid will revolve irrotationally around it, so as to fulfil the condition of no finite slip at the cylindric interface between the rotational and irrotational portions of the fluid. The expression for this motion in symbols is:—

$$T = \zeta r \text{ from } r = 0 \text{ to } r = b;$$
$$\text{and } T = \frac{\zeta b^2}{r} \text{ from } r = b \text{ to } r = a.$$

VIII. In the stable motion of minimum energy the rotational portion of the fluid is in the shape of a cylindric shell, inclosing the irrotational remainder, which in this case is at rest. The symbolical expression for this motion is—

$$T = 0, \text{ when } r < \sqrt{(a^2 - b^2)} \text{ and } T = \zeta\left(r - \frac{a^2 - b^2}{r}\right),$$
$$\text{when } r > \sqrt{(a^2 - b^2)}.$$

IX. Let now the liquid be given in the configuration VII. of greatest energy, and let the cylindrical boundary be a sheet of a real elastic solid, such as sheet-metal with the kind of dereliction from perfectness of elasticity which real elastic solids present; that is to say, let its shape when at rest be a function of the stress applied to it, but let there be a resistance to change of shape depending on the velocity of the change. Let the unstressed shape be truly circular, and let it be capable of slight deformations from the circular figure in cross section, but let it always remain truly cylindrical. Let now the cylindric boundary be slightly deformed and left to itself, and held so as to prevent it from being carried round by the fluid. The central vortex column is set into vibration in such a manner that longer and shorter waves travel round it with less and greater angular velocity.[1] These waves cause corresponding waves of corrugation to travel round the cylindric bounding sheet, by which energy is consumed, and moment of momentum taken out of the fluid. Let this process go on until a certain quantity of moment of momentum has been stopped from the fluid, and now let the canister run round freely in space, and, for simplicity, suppose its material to be devoid of inertia. The whole moment of momentum is initially—

$$\pi \zeta b^2 (a^2 - \tfrac{1}{2} b^2);$$

It is now

$$\pi \zeta b^2 (a^2 - \tfrac{1}{2} b^2) - M,$$

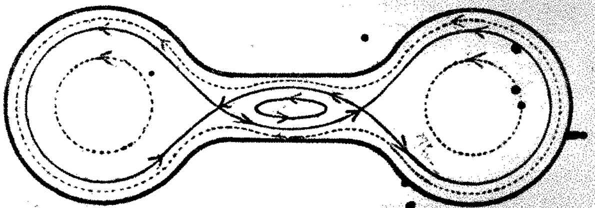
and continues constantly of this amount as long as the boundary is left free in space. The consumption of energy still goes on, and the way in which it goes on is this: the waves of shorter length are indefinitely multiplied and exalted till their crests run out into fine laminæ of liquid, and those of greater length are abated. Thus a certain portion of the irrotationally revolving water becomes mingled with the central vortex column. The process goes on until what may be called a vortex sponge is formed; a mixture homogeneous on a large scale, but consisting of portions of rotational and irrotational fluid, more and more finely mixed together as time advances. The mixture is, as indicated above, altogether analogous to the mixture of the substances of two eggs whipped together in the well-known culinary operation. Let b' be the radius of the cylindric vortex sponge, b being as before the radius of the original vortex column—

$$\tfrac{1}{2} b'^2 = \tfrac{1}{2} b^2 + \frac{M}{\zeta b^2}.$$

X. Once more, hold the cylindric case from going round in space, and continue holding it until some more moment of momentum is stopped from the fluid. Then leave it to itself again. The vortex sponge will swell by the mingling with it of an additional portion of irrotational liquid. Continue this process until the sponge occupies the whole inclosure.

After that continue the process further, and the result will be that each time the containing canister is allowed to go round freely in space, the fluid will tend to a condition in which a certain portion of the original vortex core gets filtered into a position next to the boundary, and the fluid within it tends to a more and more nearly uniform mixture of vortex with irrotational fluid. This central vortex-sponge, on repetition of the process of preventing the canister from going round, and again leaving it free to go round, becomes more and more nearly irrotational fluid, and the outer belt of pure vortex becomes thicker and thicker. The final condition towards which the whole tends is a belt constituted of the original vortex core now next the boundary; and the fluid which originally revolved irrotationally round it now placed at rest within it, being the condition (VIII. above) of absolute minimum energy. Begin once more with the condition (VII. above) of absolute maximum energy, and leave the fluid to itself, whether with the canister free to go round sometimes, or always held fixed, provided only it is ultimately held from going round in space; the ultimate condition is always the same, viz., the condition (VIII.) of absolute minimum energy.

XI. That there may be an infinite number of configurations of stable motions, each of them having the energy of a thorough minimum as said in IV. above, we see, by considering the case, in which the cylindric boundary of the containing canister consists of two wide portions communicating by a narrow passage, as shown in the sketch. If such a canister be completely filled with irrotationally moving fluid of uniform vorticity, the stream-lines must be something like those indicated in the sketch.



---

[1] See *Proceedings* of the Royal Society of Edinburgh for 1880, or *Philosophical Magazine* for 1880; Vibrations of a Columnar Vortex; Wm Thomson.

Hence if a small proportion of the whole fluid is irrotational, it is clear that there may be a minimum energy, and therefore a stable configuration of motion with the whole of this in one of the wide parts of the canister; or the whole in the other; or any proportion in one and the rest in the other; or a small portion in the elliptic whirl in the connecting canal, and the rest divided in any proportion between the two wide parts of the canister.

ON THE SPECTRA OF THE COMPOUNDS OF CARBON WITH HYDROGEN AND NITROGEN

MESSRS. LIVEING AND DEWAR have made a long series of observations on this subject, of which the following is a brief abstract[1] by the authors:—

The first experiments were made with a De Meritens dynamo-electric machine, arranged for high tension, giving an alternating current capable of producing an arc between carbon poles in air of from 8 to 10 millims. in length. The carbon poles used had been previously purified by prolonged heating in a current of chlorine.

The arc was taken in different gases inside a small glass globe about 60 millims. in diameter, blown in the middle of a tube. The two ends of the tube were closed with dry corks, through which were passed (1) the carbons inserted through two pieces of narrow glass tubing; (2) two other glass tubes through which currents of the gases experimented with were sent.

The arc taken in a globe of air gave a tolerably bright continuous spectrum, above which the green and blue hydrocarbon bands were seen, also the seven bands in the indigo (wave-lengths 4,600 to 4,502, Watts) as in the flame of cyanogen, and much more brightly the six bands in the violet (wave-lengths 4,220 to 4,158, Watts) and five ultra-violet.

Carbonic acid gas, hydrogen, nitrogen, chlorine, carbonic oxide, nitric oxide, and ammonia were then successively substituted for air in the globe, with the result that in carbonic acid, hydrogen, chlorine, and carbonic oxide, the above-mentioned bands in the indigo, violet, and ultra-violet died away, while in nitrogen, nitric oxide, and ammonia, they were always well seen.

These different gases were used in order to eliminate to a large extent the influence of electric conductivity on the character of the spectrum; and the green and blue hydrocarbon bands were seen, more or less, in all of them.

Next observations were made of the spectra of flames of sundry compounds of carbon.

In the flame of cyanogen, prepared from well-dried mercury cyanide, passed over phosphoric anhydride inserted in the same tube, and burnt from a platinum jet fused into the end of the tube, the hydrocarbon bands were almost entirely absent, as Plücker and Hittorf had found; only the brightest green band was seen, and that faintly. The indigo, violet, and ultra-violet bands, on the other hand, were well developed.

These three sets of bands in the indigo, violet, and ultra-violet are in the sequel referred to as the "cyanogen bands," though it is possible that they may be producible by other compounds of carbon with nitrogen.

The flame of hydrocyanic acid burning in air showed very much the same as that of cyanogen.

In the flame of a mixture of purified hydrogen and carbon disulphide no hydrocarbon bands at all could be detected.

Nor could they be detected in the flame of a mixture of carbonic oxide and hydrogen burnt in air.

When a mixture of hydrogen or of carbonic oxide with carbon tetrachloride vapour was burnt, hydrocarbon bands made their appearance, but were weak.

On the other hand, chloroform, when mixed with hydrogen, gave, when burnt in air, the hydrocarbon bands very strongly.

On a review of the whole series of observations, certain points stand out plainly. In the first place, the indigo, violet, and ultra-violet bands, characteristic of the flame of cyanogen, are conspicuous in the arc taken in an atmosphere of nitrogen, air, nitric oxide, or ammonia, and they disappear almost, if not quite, when the arc is taken in a non-nitrogenous atmosphere of hydrogen, carbonic oxide, carbonic acid, or chlorine. These same bands are seen brightly in the flames of cyanogen and hydrocyanic acid, but are not seen in those of hydrocarbons, carbonic oxide, or carbon disulphide. The conclusion seems irresistible that they belong to cyanogen; and this conclusion does not seem to be at all invalidated by the fact that they are seen weakly, or by flashes, in the arc or spark taken in gases supposed free from nitrogen by reason of the extreme difficulty of removing the last traces of air. They are never, in such a case, the principal or prominent part of the spectrum, and in a continuous experiment they are seen to fade out in proportion as the nitrogen is removed. This conclusion is strengthened by the observations that cyanogen (or hydrocyanic acid) is generated in the arc in atmospheric air in large quantity.

In the next place, the green and blue bands, characteristic of the hydrocarbon flame, seem to be always present in the arc, whatever the atmosphere. This is what we should expect if they be due, as Ångström and Thalèn suppose, to acetylene; for the carbon electrodes always contain, even when they have been long heated in chlorine, a notable quantity of hydrogen. In the flames of carbon compounds they by no means always appear; indeed it is only in those of hydrocarbons or their derivatives that they are well seen. Carbonic oxide and carbon disulphide, even when mixed with hydrogen, do not show them; and if seen in the flames of cyanogen, hydrocyanic acid, and carbon tetrachloride mixed with hydrogen, they are faint, and do not form a principal or prominent part of the spectrum. This is all consistent with the supposition of Ångström and Thalèn. The fact that the bands are not produced even in the presence of hydrogen, when it is not present in the flame in the form of a compound with carbon, is very significant; for we know that acetylene is present, and can easily be extracted from the flame of any hydrocarbon, and that it is formed as a proximate product of decomposition of hydrocarbon by the electric discharge, but we have no evidence that it is producible as a product of direct combination of carbon with hydrogen at the comparatively low temperature of the flames described.

The hydrocarbon bands are best developed in the blowpipe flame, that is under conditions which appear, at first sight, unfavourable to the existence of acetylene in the flame. However, by the use of a Deville's tube, acetylene may readily be withdrawn from the interior of such a flame, and from that part of it which shows the hydrocarbon bands most brightly.

The question as to whether these bands are due to carbon itself or to a compound of carbon with hydrogen, has been somewhat simplified by the observations of Watts, Salet, and others on the spectrum of carbonic oxide. It can hardly be doubted now that that compound has its own spectrum quite distinct from the hydrocarbon flame spectrum. The mere presence of the latter spectrum feebly developed in the electric discharge in compounds of carbon supposed to contain no hydrogen, weighs very little against the series of observations which connect this spectrum directly with hydrocarbons.

In the next place, it appears conclusively from the experiments, that the development of violet bands of cyanogen, or the less refrangible hydrocarbon bands, is not a matter of temperature only. For the appearance of the hydrogen lines C and F, observed by the authors in the arc taken in hydrogen, indicates a temperature far higher than that of any flame. Yet the violet bands are not seen in hydrogen at that temperature, while the green bands are well developed. The violet bands are, nevertheless, seen equally well at the different temperatures of the flame, arc, and spark, provided cyanogen be the compound under observation in the flame, and nitrogen and carbon are present together at the higher temperatures of the arc and spark.

The accompanying diagram (Fig. 1) shows approximately the relative position of the bands in that part of the spectrum of the flame of cyanogen fed with a jet of oxygen which is more refrangible than the Fraunhofer line F. Only those bands which are less refrangible than the solar line L have been before described, but photographs show two shaded bands slightly less refrangible than the solar line N accompanied by a very broad diffuse band of less intensity on the more refrangible side of N; also a strong shaded band, which appears to be absolutely coincident with the remarkable shaded band in the solar spectrum, which has been designated by the letter P; and near this, on the less refrangible side, a much fainter diffuse band, which also seems to coincide with a part of the solar spectrum sensibly less luminous than the parts on either side of it. This spectrum is remarkably persistent at all temperatures of the flame. Watts found that it did not disappear when the flame was cooled down as much as possible by diluting the cyanogen with carbonic acid; it retains its characters when the cyanogen is burnt in nitric oxide. The flame in the last case must be one of the hottest known, from the large amount of heat evolved in the decomposition of cyanogen and nitric oxide, namely, 41,000 and 43,300 units respectively. There is in the case of cyanogen, as in the case of so many other substances, a difference in the relative intensities of the different parts of the spectrum of the flame at different temperatures, but no other change of character. In the upper part of the flame where much or all of the cyanogen is oxidised or decomposed the spectrum is continuous, but at the base of the flame where it is issuing from the nozzle the cyanogen bands are always seen both when the cyanogen is burning in oxygen and when it is burning in nitric oxide. This is what we should anticipate, provided intermediate, and not the final, compounds are the active sources of the banded spectrum.

---

[1] For fuller details see *Proc.* R.S., xxx. pp. 152, 494.

Each of the five sets of bands shown in the diagram is attended on its more refrangible side by a series of rhythmical lines extending to a considerable distance, not shown in the diagram, but easily seen in the photographs.

Coal gas burning in oxygen gives no bands above that near G within the range of the diagram, Fig. 1; but beyond this photographs show a spectrum of a character quite different from that at the less refrangible end, which the authors have traced to be due to water and described elsewhere (*Proc.* R. S., No. 205).

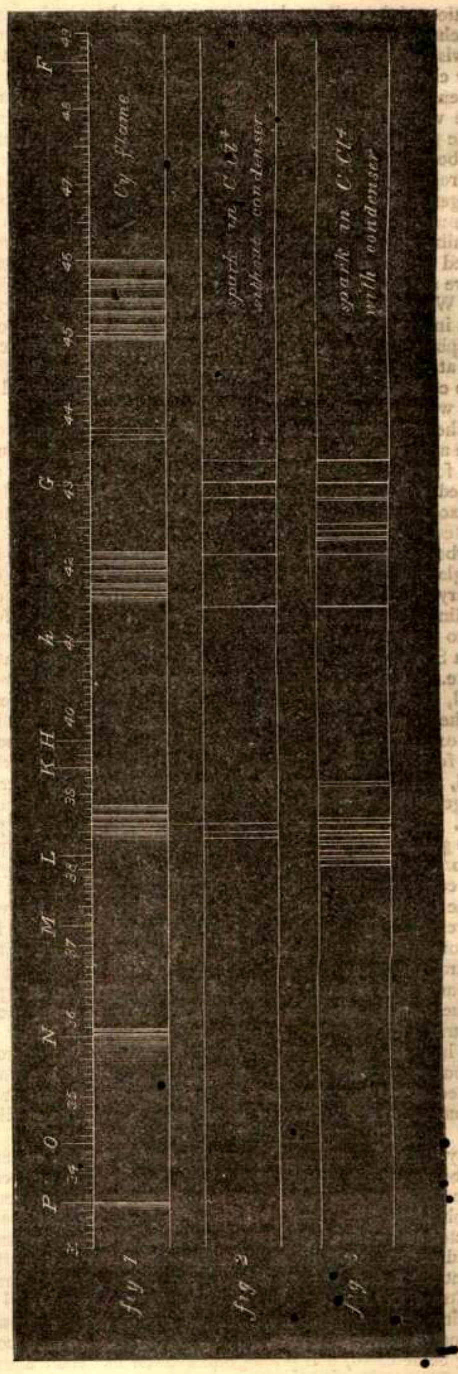
The authors then describe experiments with carbon tetrachloride, conducted with great care and numerous repetitions because of the prominence given to an experiment with this compound by Mr. Lockyer in a recent "Note on the Spectrum of Carbon," and because their results in every case differ from those which he obtained.

The form of sparking tube employed was similar to that used by Salet. This was attached by thick rubber tubing to a straight glass tube of which one half, about 6 inches long, was filled with phosphoric anhydride, and the other half with small fragments of soda-lime to prevent any chlorine from the decomposition of the tetrachloride by the spark from reaching the Sprengel pump. The tetrachloride used had been fractionated until it had a constant boiling point of 77° C. Sufficient of it was introduced into the sparking tube to fill nearly one quarter of the bulb at the end, and the whole interior of the tube thoroughly wetted with it in order to facilitate the removal of the last traces of air.

When the tube containing the tetrachloride had been so far exhausted that little but condensible vapours were pumped out, the bulb was heated so as to fill the apparatus with vapour of tetrachloride, the pump still going, and this was repeated as long as any incondensible gas was extracted. Sparks were then passed through the tube for a short time, the pump still being kept going. After a short time it was unnecessary to keep the pump going, as all the chlorine produced by decomposition of the tetachloride was absorbed by the soda-lime. On now examining the spectrum, no trace of any of the cyanogen bands could be detected, either by the eye or by photography, however the spark might be varied. The violet lines of chlorine described by Salet were more or less visible, coming out brightly when a condenser was used. Several tubes were treated in this way, and many photographs taken, but always with the same result; no trace appeared of either the seven blue, the six violet, the five ultra-violet, or of the still more refrangible bands of the cyanogen flame. It is true that all the photographs showed three lines in the ultra-violet, but these do not at all closely resemble the cyanogen bands, they are not shaded like them. The least refrangible of the three is coincident with the middle maximum in the ultra-violet set of five bands, but the other two do not coincide with other of these maxima. When a condenser is used, these three lines come out with much greater intensity, and two other triplets appear on the more refrangible side, as well as other lines.

The general character of the violet part of the spectrum of the spark in carbon tetrachloride taken without a condenser, but not the exact position to scale of wave-lengths of all the lines, is shown in Fig. 2. Fig. 3 shows the brightest of the additional lines which come out with the use of a condenser. Photographs of sparks taken in hydrochloric acid showed a precisely similar group of ultra-violet lines, so that there is no doubt that the three lines which the photographs show near the place of the ultra-violet cyanogen bands are due to chlorine.

Repeated trials in which the arrangements were varied having shown that pure carbon chloride, if free from nitrogen, does not give any of the bands ascribed to compounds of carbon with nitrogen, the next step was to determine whether the addition of nitrogen would bring them out, and if so what quantity of nitrogen would make them visible. For this purpose the binding of the rubber tube connecting to the pump a sparking tube containing tetrachloride and found to give no cyanogen bands, was loosened, and, after letting in very little air, immediately closed again. On now passing the spark the six violet bands at once appeared, and the seven blue bands also were in a short time well seen.



After trying some other experiments of a similar kind which indicated that a very small quantity of nitrogen was sufficient to develop the cyanogen bands in one of these tubes, a minute fragment of bichromate of ammonia, carefully weighed and wrapped in platinum foil, was introduced into the neck of one of the sparking tubes containing carbon tetrachloride, the tube connected to the Sprengel pump, and the air removed as before. On examination of the spark with the spectroscope no trace of any cyanogen band could be detected. A pinch-cock was now put on the rubber tube, and the bichromate was heated by a spirit lamp to decomposition (whereby it is resolved into nitrogen, water, and oxide of chromium). On now passing the spark the six violet bands were well seen. There was no change in the condition of the coil or rheotome, so that the spark was of the same character as it had been before when no cyanogen bands were visible, and the change in the spectrum cannot be attributed to any change in the spark. The weight of the bichromate was between ·0005 and ·0006 grm., and the nitrogen this would evolve would fill just about $\frac{1}{20}$ of a cubic centimetre at atmospheric pressure. The tube held 30 cub. centims., so that vapour of carbon tetrachloride when mixed with $\frac{1}{600}$ part of its volume of nitrogen, gives under the action of the electric spark the cyanogen bands distinctly. Other similar experiments confirmed this result.

Similar experiments with carbon bisulphide, benzol, and well-purified naphthaline, gave like results when care was taken to remove air completely.

As Watts laid much stress on the occurrence of the cyanogen bands in the spectrum of the spark taken in carbonic oxide at atmospheric pressure (though they do not appear in carbonic oxide at reduced pressures), as a proof that these bands were due to carbon only, the authors made a series of careful experiments with carbonic oxide at atmospheric pressures.

In the first experiments with this substance the gas was made by the action of sulphuric acid on dried formiate of sodium, and it was found that the cyanogen bands disappeared as air was expelled from the apparatus, reappearing brightly when air, not exceeding $\frac{1}{400}$ of the whole gas in the apparatus, was admitted.

Carbonic oxide was next generated by heating, in a tube of hard glass in an ordinary combustion furnace, a mixture of pure and dry potassium oxalate with one quarter of its weight of quicklime, the mixture having been previously heated for some time so as to expel traces of ammonia. The tube was connected with a Sprengel pump, and the air exhausted before heating the oxalate. The distant end of the tube with the oxalate was then heated, and the whole apparatus filled with carbonic oxide; it was then again exhausted with the pump, refilled by heating more oxalate, and the gas allowed to stream out through the pump for some time. The heat was then lowered, sparks were passed, and the spectrum observed. No trace whatever of the cyanogen bands could be detected, however the spark might be varied. The pump was now set going again, and the pressure of the gas reduced to one inch of mercury, while the spectrum was observed from time to time. Still no trace of the cyanogen bands could be detected. More of the oxalate was next heated, and the observations repeated again and again, always with the same result. The conclusion was that carbonic oxide, if quite free from nitrogen, does not give, at the atmospheric or any less pressure, the cyanogen bands.

From Dr. Watts's account of his experiments, it appeared that he had used carbonic oxide prepared by the action of sulphuric acid on ferrocyanide, and it was probable that it might have been contaminated with nitrogen, or with nitrogenous compounds, from the ferrocyanide. The authors accordingly repeated their experiments with carbonic oxide so prepared, and found that the cyanogen bands were then always distinctly seen.

They have also repeated Ångström and Thalén's experiments with the spark between carbon poles in nitrogen and carbonic acid gas. They observed that in nitrogen the cyanogen bands were plainly visible through a great range of variations of the character of the spark; even the use of a condenser of moderate size did not diminish them. Photographs were taken with and without the use of the condenser, and these showed the violet and ultra-violet cyanogen bands, including those near N and P. The nitrogen was then swept out by a current of carbonic acid gas, and on now passing the spark the cyanogen bands could no longer be detected, and photographs taken as before showed no trace of any of them.

Other experiments showed the sensitiveness of the spectroscopic tests for compounds of carbon with nitrogen, and that all traces of water can hardly be removed from apparatus and reagents which do not admit of being heated red hot.

The first point the authors had before them in these investigations is whether the groups of shaded bands seen in the more refrangible part of the spectrum of a cyanogen flame are due to the vapour of carbon uncombined, or, as they conclude, to a compound of carbon with nitrogen.

Now the evidence that carbon uncombined can take the state of vapour at the temperature of the electric arc is at present very imperfect. Carbon shows at such temperatures only incipient fusion, if so much as that, and that carbon uncombined should be vaporised at the far lower temperature of the flame of cyanogen is so incredible an hypothesis that it ought not to be accepted if the phenomena admit of any other probable explanation. On the other hand, it has been shown that cyanogen or hydrocyanic acid is generated in large quantity in the electric arc taken in nitrogen, and Berthelot has shown that hydrocyanic acid is produced by the spark discharge in a mixture of acetylene and nitrogen, so that in the cases in which these bands shine out with the greatest brilliance, namely, the arc in nitrogen and the cyanogen flame, we know that nitrocarbon compounds are present. Further, the authors have shown that these bands fade and disappear in proportion as nitrogen is removed from the arc. Ångström and Thalén had previously shown the same thing with regard to the spark discharge between carbon electrodes; and the conclusion to which they have come would probably have commanded universal assent if it had not been for the fact that these bands had been seen in circumstances where nitrogen was supposed to be absent; but where, in reality, the difficulty of completely eliminating nitrogen, and the extreme sensibility of the spectroscopic test, had been inadequately apprehended.

To clear up the question from this point of view, the experiments last described have been made, and they appear to the authors quite conclusive. Were the evidence less conclusive than it is, it would still be as rash and as illogical to conclude from the appearance of the cyanogen bands in a case where nitrogen was presumed, not proved, to be absent, that they were not due to a compound of carbon with nitrogen, as it would be to deny that the well-known yellow lines were due to sodium, because they had been seen in cases where sodium was supposed to be absent. The argument of the authors is an induction from a very long series of observations which lead up to one conclusion, and hardly admit of any other explanation. But Mr. Lockyer attempts to explain the disappearance of the bands when nitrogen is absent by the statement "that the tension of the current used now brings one set of flutings into prominence, and now another." This is no new observation. It is well known that variations in the discharge produce variations in the relative intensities of different parts of a spectrum. Certain lines of magnesium, cadmium, zinc, and other metals, very brilliant in the spark, are not seen, or are barely seen, at all in the arc. His remark might be applied to the spectra of compounds as well as to those of elements. Variation in the discharge accounts very well for some of the variations of intensity in the bands if they be due to a compound of carbon with nitrogen; it will not, however, account for the fact that the bands, or those of them which have the greatest emissive power, and are best developed by the particular current used, come out on the addition of a minute quantity of nitrogen, when there is every reason to think that no variation of the current occurs.

Much the same may be said with regard to the changes of the spectrum produced by changes of temperature. We cannot infer from any of these changes that the spectrum is not due to a compound. The bands in question are singularly persistent through a great range of temperatures, from the temperature of a cyanogen flame cooled by admixture with carbonic acid gas, as related by Watts (*Phil. Mag*, 1869, p. 258), to that of the spark of an induction coil with condenser.

But again, Mr. Lockyer attempts to get over the difficulties of his case by the supposition that "the sets of carbon flutings represent different molecular groupings of carbon, in addition to that or those which give us the line spectrum."

Now, until independent evidence that carbon can exist at all in the state of vapour uncombined at the temperature of a cyanogen flame can be adduced, and further independent evidence of the existence of different groupings in such vapour, the hypothesis here enunciated is a gratuitous one, so long as any other hypothesis for which independent evidence can be adduced, as is true of the existence of nitrocarbon compounds in the flame, arc, and spark, will sufficiently explain the facts.

The authors have not expressed any opinion whether or no the cyanogen bands are visible in the solar spectrum. The observation above recorded that there is in the spectrum of cyanogen a strong shaded band coincident with the very characteristic dark shaded band P, strengthens materially the evidence in favour of the existence of these bands in the solar spectrum; the more so as the series of lines at P has far more of the distinctive character of the cyanogen spectrum than any other series in the ultra-violet part of the solar spectrum.

However that may be, they contend against the hypothesis that if present the bands can be due to any vapour of carbon uncombined in the upper cooler region of the chromosphere. One object of their investigations has been to determine the permanence of compounds of non-metallic elements and the sensitiveness of the spectroscopic test in regard to them. It appeared probable that if such compounds existed in the solar atmosphere their presence would be most distinctly revealed in the more refrangible part of the spectrum, and it seems sufficiently clear that the presence of nitrogen in the solar atmosphere may be recognised through cyanogen when free nitrogen might escape detection.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

OXFORD.—The Millard Scholarship in Natural Science lately founded at Trinity College has been awarded for the first time. The successful candidate is Mr. R. Bodey, from the Mining School, Bristol, and from the Royal School of Mines.

At Exeter College the Natural Science Scholarship has been awarded to Mr. B. Spencer, from King's College, London.

According to the report of the Delegates for unattached students, the number of students not attached to any college or hall has increased by twenty during the past year. Seventy unattached students have become members of colleges or halls during the year.

CAMBRIDGE.—The University of Cambridge Commissioners have apparently proposed their final arrangements as regards the University. There are many modifications from the original scheme in the direction of giving more freedom to the University, and on the whole in favour of scientific objects. A general financial board is to manage all University property and expenditure, and to control especially the college contributions. The rating of the colleges for University purposes is modified in the direction of increased fairness. The common University Fund derived from the colleges is to provide for all classes of University teachers, for the salaries of demonstrators, superintendents, and curators, for the erection, maintenance, and furniture of museums, laboratories, libraries, lecture-rooms; and in addition grants of money may be made from it for special work in the way of research, and for investigations in any branch of learning or science connected with the studies of the University. The amount of payments for buildings, and their maintenance, furniture, and apparatus, is not to exceed one-third of the income of the fund in any one year.

Practically speaking, there may be available in each year to the end of 1884, 2,000*l*. a year for these latter purposes and 4,000*l*. for investigators and teachers, and the college payments will rise definitely to 30,000*l*., of which 10,000*l*. may be used for the purposes of buildings, and 20,000*l*. for teachers of all kinds.

It is no longer sought to force particular professors on particular colleges; the college may, if it prefers, pay the income of a Professorial Fellowship to the common fund. There are to be twenty-nine Professorial Fellowships, not assignable to particular professors, but distributed among the colleges.

The stipends of the Professors, payable by the University, are to have 200*l*. deducted from them if the Professor holds a Professorial Fellowship or a Headship. The stipends of Professors as now proposed are not so unequal as in the first proposed statutes. The payments (subject to the above-mentioned deduction) to the Regius Professor of Physic would be 700*l*., Professor of Chemistry and the Cavendish Professor of Physics 850*l*. each, Physiology 800*l*., Pathology 800*l*., Botany, Zoology, and Woodwardian of Geology 700*l*. each, Anatomy 600*l*. The new Professorships are to be for (1) Physiology, (2) Pathology, (3) Mental Philosophy and Logic. The first two professors are not to undertake the private practice of medicine and surgery. When these shall have been established, the University may establish any other professorships it pleases, or has funds for.

The proposals for readerships are also to be remarkably modified; the minimum number of readers is now twenty. The subjects are to be within the control of the University; the readers are to be appointed as soon as funds can be provided conveniently from the common University Fund or from other sources. Readerships may be suppressed or created, according to the needs of study. The stipend is to be 400*l*. The readers are to be appointed by grace of the Senate on the recommendation of the General Board of Studies now to be created; but in each case the special Board of Studies with which the readership is connected must concur in the appointment, or it will lapse to the Council of the Senate.

University Lecturers (the next grade of teachers) may be college lecturers who throw open their lectures to the University, or they may be other persons approved by the Boards of Studies.

The payment to these lecturers from the University must be not less than 50*l*. The University may also appoint lecturers on subjects not immediately connected with any special Board of Studies, for shorter or longer terms. The separation of the Board of Studies in Physics and Chemistry from that of Biology and Geology is maintained. The constitution of the General Board of Studies is carefully and completely defined; but it is to do such work as the Senate commits to it, and in future a general University budget is to be prepared and submitted to the Senate.

The Cambridge Museums and Lecture Rooms Syndicate find the increase of annual grant from the University from 1,500*l*. to 2,000*l*. a year inadequate, owing especially to new outlay on new departments. They now have a balance of 821*l*. against them; and they ask for an additional 1,000*l*. per annum at once, feeling quite unable otherwise to maintain the museums in moderate efficiency with strict economy.

SCIENTIFIC SERIALS

Journal of the Franklin Institute, September.—Experiments on the compression of air by the direct action of water, by J. P. Frizell.—Experiments on the strength of yellow pine, by R. H. Thurston.—The absolute economy of electric lighting, by R. Briggs.—Note on the artificial production of diamonds by the processes of Despretz, by E. J. Houston.

October.—Motion of viscous fluids, by T. Craig.—The steam yacht *Anthracite* and the Perkins system of high pressure steam, by G. Deane.—Coal gas engineering, by R. Briggs.—Holman's new illustration of cell-formation, by J. M. Child.—Joseph Henry, by A. M. Mayer.

American Naturalist, October.—S. A. Forbes, the food of the darters.—J. C. Russell, on the former extent of the triassic formation of the Atlantic slates.—C. C. Abbott, notes on stone implements found in New Jersey.—S. Lockwood, some noteworthy birds.—W. K. Higley, on the microscopical crystals contained in plants.—The editor's table.—Biology at the American Association at Boston.—Recent literature.—General notes.—Scientific news.

Reale Istituto Lombardo di Scienze e Lettere. Rendiconti, vol. xiii. fasc. xvi., July 29.—On a particular univocal correspondence between elements of space with three dimensions, by F. Aschieri.—Case of unproductivity of corn, by G. Cantoni.—On the thermal and luminous phenomena manifested by the Leyden jar at the moment of its discharge, by E. Villari.—Transformation of aspartic acid into fumaric acid, by G. Korner and A. Menozzi.—First case of repeated peritoneal transfusion, with new and happy success, in an oligocitemic insane person, by C. Golgi and A. Raggi.—On the infirmity of Torquato Tasso, by A. Corradi.—Meteorological summary of the year 1879, from meteorological observations at the Brera Observatory, by P. Frisiani.

Rivista Scientifico-Industriale, September 15.—Further experiments with a Crookes' tube, by A. Righi.—Histology of the skin of Teleostean fishes, by A. Batelli.

SOCIETIES AND ACADEMIES

LONDON

Entomological Society, October 6.—H. T. Stainton, F.R.S., vice-president, in the chair.—Sir Arthur Scott of Birmingham and Mr. F. E. Robinson were elected as ordinary Members.—Mr. McLachlan stated that last year he had exhibited specimens of *Anthocoris nemorum*, an hemipterous insect supposed to be damaging the hops grown near Canterbury, but had then expressed his opinion that the insect was not the true culprit, its habits being probably carnivorous. This year he had received from the same correspondent some small larvæ which had been found in the cones, and these he considered were not only the true enemy of the hops, but were also the food of the *Anthocoris*.—Sir Sydney Saunders exhibited a series of apterous females of the new species of *Seteroderma*, adverted to at the previous meeting, and read remarks thereon.—Messrs. Kirby, Fitch, Ralfe, and the Rev. E. N. Gilbert exhibited several varieties of lepidoptera taken in this country and on the Continent, some of which, from the structure of the antennæ, were considered "hermaphrodite" forms.—Mr. Hildebrand Ramsden communicated a note on *Pyrophorus causticus*, a Cuban fire-fly.—Mr. Swinton read two papers entitled Some Experiments on the Variability of Lepidoptera undertaken during the year 1880, and exhibited specimens and figures in illustration.—Mr. Butler communicated a paper entitled Observations on the Lepidopterous Genus *Terias*, with descriptions of hitherto un-named forms from Japan.—Mr. Waterhouse communicated a paper on the Buprestidæ from Madagascar.—Messrs. Kirby, Distant, and McLachlan called the attention of the Society to a method of publishing descriptions of new species pursued by M. André in recent parts of his work on European Hymenoptera. These were not only inserted on the *cover* of his quarterly parts, but even at the end of sheets of advertisements laid loosely between the pages of a part. It was regretted that no other course than that of protest and disapprobation could be applied in the interest of science to such a practice.

PARIS

Academy of Sciences, October 18.—M. Wurtz in the chair.—M. Faye presented the *Connaissance des Temps* for 1882 (204th volume), and indicated several improvements, viz., tables giving, for all points of the globe where the next Venus transit will be visible, the instants of all phases of the transit, a table for determining the direction of the meridian from the Pole star, the positions of 300 important stars every ten days, and of ten polar stars daily, and empiric corrections of ephemerides of the moon.—Longitude of the coast of Brazil, by M. Mouchez. A scientific mission from the United States under Messrs. Green and Davis has, with the aid of the Transatlantic cable from Europe, fixed the position of the six points, Para, Pernambuco, Bahia, Rio de Janeiro, Montevideo, and Buenos Ayres; and the results show that the author's figures for the same places, obtained in 1860 and following years, by astronomical and chronometric methods, were nearly exact, the greatest error being 2·34s. (The *Connaissance des Temps* had adopted different numbers, which are shown to be in error 27·4s.) The author's errors being all of the same sign, a mere shifting of the Brasil coast about 2 sec. westwards (nearly 1km.) would make the longitudes exact to a few tenths of a second. He compares the chronometric and astronomical methods, showing that chronometers, in absence of the telegraph, offer the surest and most simple means of determining longitude. The influence of temperature he corrected by means of a simple coefficient.—On the saccharine matters contained in the fruit of the coffee-tree, by M. Boussingault. He analysed some berries (from Brazil) that had been put in alcohol immediately after plucking, also the alcohol. The berry is poor in saccharine pulp compared with cherries and other stone fruit from which alcohol is got (it has 66 per cent. as against 90 for cherries and 95 for prunes). The distillation of the berries of coffee would hardly be lucrative or practicable (as Humboldt imagined).—Order of appearance of the first vessels in the inflorescence of *Mibora verna*, by M. Trécul.—On the resistance of animals of bovine species to splenic fever, and on the preservation of these animals by preventive inoculations, by M. Chauveau. He mentions that, contrarily to what is observed in France, it is in animals of bovine species that anthracoid diseases are more frequently met with in Algeria. He is inquiring what it is that favours the effects of spontaneous infection in the bovine species, so resistant to provoked infection, and hopes soon to be able to furnish the explanation. The preventive effect of inoculation he has proved in eight subjects of bovine species (four of which were Algerian).—On the photophone of Prof. Bell and Mr. Sumner Tainter, by M. Breguet. A drawing is given of the arrangement found most effective. At M. Breguet's place the phenomena have been obtained with the electric light over a distance of 15m. The articulation, though not perfect, was demonstrative.—Spectroscopic studies of the sun at Paris Observatory, by M. Thollon. The sun has entered on a period of activity. M. Thollon gives figures of several striking recent protuberances. He frequently observes protuberances 1′ in height, and has seen several exceeding 2′ and 3′, and one about 8′. Some of them may nearly reach the limits of the corona. He indicates his new method of ascertaining the direction of the solar equator.—Principles of an algebraic calculus which contains, as particular species, the calculus of imaginary quantities and of quaternions, by M. Lipschitz.—On algebraic equations, by M. West.—Vibratory forms of circular pellicles of saposaccharic liquid (second note) by M. Decharme. This refers to the relative position of the nodals of each system. One finds identical laws for vibratory forms of any circular liquid surfaces, and for those of soapy pellicles; only the width of the zones is about six times smaller in the case of the former.—On the presence of cerium in the coal-formation of the valley of Saint-Étienne, by M. Mayençon.—On a very perfect reptile found in the Permian formation, by M. Gaudry. M. Roche found it at Igornay, and has presented it to the Paris Museum. M. Gaudry proposes to call it *Stereorachis dominans*. Its vertebræ are in striking contrast with those of other reptiles in the same bed; the centrums are in one piece, which adheres to the neural arc. Another mark of superiority is that its humerus has, in the distal part, a neuro-arterial canal. The *Stereorachis* was a pretty large carnivore. It has affinities with the Ganocephali and Labyrinthodonts, and perhaps still more with some of the animals in Mr. Cope's group of Pelycosaurians, in North America.—On the existence of a reptile of ophidian type in the *Ostrea columba* strata of the Charentes, by M. Sauvage.

BERLIN

Geographical Society, October 9.—President Dr. Nachtigal, who congratulated Dr. Bastian on his return from his two years' exploration.—A letter from Dr. Buchner was read, dated September 27 of last year from Kimbundo. Since then, it has been learned, he has not only reached the residence of Muata Janvo, but has carried his exploration much farther. It is probable that he has gone northwards.—News was received from Dr. Lenz, which we refer to in our Geographical Notes. By the last news Herr Flegel had reached the confluence of the Niger and Binné, and his expedition was doing well.—The German expedition to East Africa was, according to the last news, at Muhatta, with Capt. Ramaeker's Belgian expedition, on the way to Tabora.—Prof. Credner of Halle read a paper on the glaciation of North Germany during the glacial period.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 549, Vol. 22] THURSDAY, MAY 6, 1880 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

CITY AND GUILDS OF LONDON INSTITUTE for the ADVANCEMENT OF TECHNICAL EDUCATION.

Summer Courses of LECTURES and LABORATORY INSTRUCTION at the Temporary Class Rooms of the Institute, Cowper Street, Finsbury, commencing May 5, 1880:—

By Prof. Armstrong, Ph D., F R.S.

CHEMISTRY. 24 Day Lectures Wednesdays and Fridays, 3 to 4. 5s.

FUEL and ELECTRO-DEPOSITION of METALS. 12 Evening Lectures. Mondays, 8 to 9. 2s 6d.

PHOTOGRAPHIC CHEMISTRY Tutorial and Laboratory Course. 10s.

By Prof. Ayrton. A.M. Inst. C.E.

PHYSICS. 24 Day Lectures. Wednesdays and Fridays, 4 to 5. 5s.

STEAM. 12 Evening Lectures. Mondays, 7 to 8. 2s 6d.

ELECTRICAL ENGINEERING Tutorial and Laboratory Course 10s.

Laboratories open daily from 10 to 1 and from 2 to 5; Wednesday and Friday Evenings from 7 to 9.

Detailed prospectus to be had on application to the Professrs at Cowper Street Schools, or to

PHILIP MAGNUS, B Sc, B A., Director and Secretary.
Gresham College, Basinghall Street, E.C.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S E

The SUMMER SESSION will commence on May 1st Students entering in the Summer are eligible to compete for the Natural Science Scholarships of £60 and £40 to be awarded in October. Special Classes are held to prepare for the Matriculation, Preliminary Scientific and 1st M B Examinations of the University of London There are numerous Prizes and Scholarships, and all appointments are open to Students without charge. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars may be obtained from the Secretary, Dr. Gillespie.

W M. ORD, M D, Dean.

DENTAL HOSPITAL OF LONDON,

LEICESTER SQUARE.

President, H.R.H. the Duke of Cambridge, K G., and the London School of Dental Surgery.

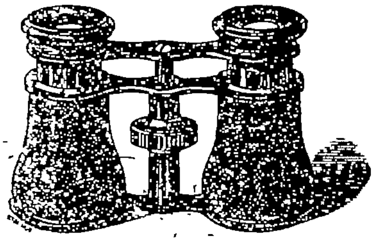
The Posts of LECTURER on METALLURGY and on MECHANICAL DENTISTRY at the above School are Vacant Candidates for the Appointments are requested to send in their applications to the Honorary Secretary at the Hospital on or before July 1st next. The Candidates for the post of Lecturer on Mechanical Dentistry must hold the Dental Diploma of the Royal College of Surgeons of England.

EVENING LECTURES ON PHOTOGRAPHY —Mr W. J. WILSON, F.C S, M S.T E, will deliver a Course of Ten Lectures on Practical Photography at the Birkbeck Institution, Southampton Buildings, W C., on Thursdays, at 8 p m, commencing May 13 Fee for the Course, £1 Detailed Syllabus on application to the Librarian

---

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

BROWNING'S "SOVEREIGN" OPERA.



The "Sovereign" Double Achromatic Opera Glass, with Screw adjustments, Six Lenses, Body covered with Morocco, in Crush Leather Case ... ... price £1 0 0

SENT CARRIAGE FREE.

JOHN BROWNING,
63, STRAND, LONDON, W.C.

CIVIL SERVICE COMMISSION.—Open Competition in London for one Situation as JUNIOR SECOND ASSISTANT, Royal Herbarium, Kew, May 25 Age 18–30. Technical training and qualifications necessary Regulations and Forms of Application may be obtained at once from the Secretary, London, S.W.

A WRANGLER, Fellow of his College, wishes to find EMPLOYMENT in or near London for a couple of hours a day.—Apply to P. K., Union Society, Cambridge

---

NEW ATHENÆUM CLUB, 26, Suffolk Street, Pall Mall, S.W., for Members of Scientific Societies and Graduates of Universities. Limited to 1,000 Members The fourth 250 Members to complete the Club are now being admitted Number of Members, May 4th, 1880, 902. J. LOGAN LOBLEY, Secretary

---

HOFWYL SCHOOL, HOFWYL, near BERNE, SWITZERLAND, founded by EMANUEL DE FELLENBERG, offers sound instruction in the ancient, but especially in the modern, languages, mathematics, and natural sciences.

For Prospectus and further particulars apply to Dr. Leonhard Schmitz, LL.D., 26, Belsize Park Gardens, London, N.W., or to the Head-Master, Mr. A. F. Andresen, Hofwyl.

DIAMONDS AND OTHER PRECIOUS STONES. Scientific opinion given as to GENUINENESS, PURITY, and VALUE.—Bryce Wright, 90, Great Russell Street, London.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology, and every branch of Microscopy. Catalogue post free and gratis on application.

PARIS UNIVERSAL EXHIBITION, 1878.

Prize Medal awarded for Excellence, Variety, &c.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

THE LONDON LIBRARY,

12, ST. JAMES'S SQUARE, S.W.

President.
Thomas Carlyle, Esq.
Trustees
Earl of Carnarvon, Lord Houghton, Earl of Rosebery
Committee.

Sir James Alderson, F. W. Burton, Esq., Rev. Canon Cheetham, J. C. Conybeare, Esq., W. Courthope, Esq., Sir Frederick Elliot, Rev. E. E. Estcourt, H. W. Freeland, Esq, Sydney Gedge, Esq, Prof. Gladstone, F. Harrison, Esq., Dr. J. J. Jusserand, C. M Kennedy, Esq., Rev. Stanley Leathes, D.D, W. Watkiss Lloyd, Esq., H. Maxwell Lyte, Esq., James Cotter Morison, Esq., Earl of Morley, Rev. Mark Pattison, Dr. Munk, F. Pollock, Esq, Rev. Dr. Reynolds, Herbert Spencer, Esq., Leslie Stephen, Esq.

The Library contains 90,000 Volumes of Ancient and Modern Literature, in various languages. Subscription, £3 a year, or £2 with Entrance Fee of £6; Life Membership, £26. Fifteen Volumes are allowed to Country and Ten to Town Members. Reading Rooms open from Ten to Half-past Six. Catalogue, *new edition*, 1875 (1,062 pp.), price 16s; to Members, 12s. Prospectuses on application.

ROBERT HARRISON, Secretary and Librarian.

MINERALOGY AND GEOLOGY.

COLLECTIONS OF 200 SPECIMENS IN CABINETS,

Specially adapted for Students and Teachers, price 42s.

Smaller Collections at same rate. These Collections are used with success by nearly all geological science teachers in the United Kingdom. Single Specimens and every requisite of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

See new Lists of Collections, new List of Apparatus, &c. Established 22 years in London.

TO CURATORS AND OTHERS.—W. H. SHRUBSOLE, F G S., Sheerness-on-Sea, offers for Sale, together or separately, a number of very choice and some unique specimens from the London Clay, including *Chelonia*, *Crocodilus*, *Palæophis*, *Argillarius longipennis*, *Aturia zic-zac*, Fish Crania, &c., &c. An inspection is invited.

LIVING DIATOMS.

The wonderful *Bacillaria paradoxa*, which continually extends and closes up in a most extraordinary manner.

Also *Pleurosigma quadratum*, and others. Tubes, 1s. post free.

W. SHRUBSOLE, JUN, Sheerness-on-Sea.

NORTH BRITISH AGRICULTURIST is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

MUSEUMS AND COLLECTORS.

MR. DAMON, of WEYMOUTH, will forward an abridged Catalogue of his Collections in Natural History Objects, including RECENT SHELLS (Foreign and British), FOSSIL REMAINS, MINERALS, ROCKS, MARINE ZOOLOGY, &c., &c., &c.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, MICROSCOPIST'S and NATURALIST'S STUDIO, 17, ANN STREET, BIRMINGHAM.

T B. has last week sent to his subscribers specimens of one of the Pitcher Rotifers, *Brachionus urceolaris*, with drawing and description. He has also sent out the larval form of the Shore Crab, *Carcinus mænas*, in the Zoea stage, and young Eels or Elvers.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

PORTFOLIO OF DRAWINGS, No. 1 and 2, ONE SHILLING EACH.

MINERALOGY AND GEOLOGY.

Just received, the following Minerals for Chemical Purposes:—
SHORLOMITE, RUTILE, ZIRCON, BERYL, ALLANITE, COLUMBITE, WITHERITE, CERITE, EUXENITE, THORITE, PHENAKITE.

Also Specimens of TOPAZ, Crystals of SENAMONTITE, BERYLS (terminated), GROSSULAR, ZIRCON, MICROLINE, NATIVE PLATINUM, ACMITE, PSEUDOMORPHOUS GARNET, GREEN WAVELLITE, CERUSSITE, NATIVE MERCURY, SODALITE, BROOKITE, PEROFSKITE, ARAGONITE, ALEXANDRITE, PROUSTITE

BLOWPIPE CASES AND OTHER APPARATUS
COLLECTIONS FOR STUDENT OR TEACHER, from £2 2s.
ELEMENTARY COLLECTIONS, from 4s.
Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

VOLCANIC BOMBS,

INTERESTING LAVAS & MINERALS,

FROM

VESUVIUS, SOMMA, OLIBANO, PIANURA, AND SOLFATARA.

THOMAS J. DOWNING (Geologist, &c.),
38, WHISKIN STREET, E C., LONDON.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence. Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R McLACHLAN, F.R.S., E. C. RYE, F.Z.S, and H. T. STAINTON, F R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year

Vols I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row

N.B.—Communications, &c., should be sent to the Editors at the above address.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.
REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.
The Organ of the Country Brewers

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests, Subscription, 16s 6d. per annum, post free, dating from any quarter-day. Single Copies 1s each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E C.

On the 1st of every Month, price Sixpence.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.
Edited by JOHN T CARRINGTON,
With the Assistance of
FREDERICK BOND, F Z S. | JOHN A. POWER, M D
EDWARD A. FITCH, F L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science, on Insects injurious or beneficial to Farm or Garden, Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

THE BEST FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture,

Devotes special attention to the discussions and proceedings of the Chamber of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to ensure delivery to country subscribers by the first post on Tuesday morning Price 3*d.*, or prepaid, 15*s.* a year post free.

Published by W. PICKERING, 21, Arundel Street, Strand, W C.

PRICE 1*s.* MONTHLY.

MACMILLAN'S MAGAZINE FOR MAY, 1880.

CONTENTS.

1.—"He that Will not when He May." By Mrs. Oliphant. Chapters XXIII.—XXV.
2.—"Our London Correspondent" By T Wemyss Reid.
3.—"An Escape for Life from a Fijian Cyclone."
4.—"The Book of Dumbartonshire." By J. Scott Keltie.
5.—"Shelley's Life near Spezzia, his Death and Burials" By H. Buxton Forman.
6.—"Dr. Channing, the Abolitionist." By Thos. Hughes, Q.C.
7.—"Tara; or, Shakspere in Bengal." By Harold Littledale.
8.—"The Liberal Majority." By James R. Thursfield

BRAIN:

A QUARTERLY JOURNAL OF NEUROLOGY.

EDITED BY

J. C. BUCKNILL, M D., F R S, J. CRICHTON-BROWNE. M.D, LL D., D. FERRIER, M.D, F.R S, AND J. HUGHLINGS-JACKSON, M.D., F.R.S.

Contents.

ORIGINAL ARTICLES:—
- A Plea for the Neurotic Theory of Gout. By Dyce Duckworth, M.D. (Edin.).
- The Conditions of the Unipolar Stimulation in Physiology and Therapeutics. By A. de Watteville, M A, B.Sc.
- The Anatomy and Physiology of the Chorda Tympani Nerve. By Horatio R. Bigelow, M D.
- On the Paralysis which results from Angular Curvature of the Spine. By John Duncan, M.D.
- On some Varieties of Cervical Paraplegia. By Thomas Buzzard, M D
- Distribution of the Arteries of the Spinal Cord. By James Ross, M.D.

CRITICAL DIGESTS AND NOTICES OF BOOKS:—
- Nothnagel on the Regional Diagnosis of Diseases of the Brain. By D. Ferrier, M.D.
- Huxley on the Crayfish. An Introduction to the Study of Zoology. By F. Jeffrey Bell.
- Gowers on Pseudo-hypertrophic Muscular Paralysis. By Robert Saundby, M.D.
- The Index Medicus.
- Morris on Skin Diseases.

CLINICAL CASES:—
- Arrest of Development in the Left Upper Limb, in association with an extremely small Right Ascending Parietal Convolution. By H. Charlton Bastian, M.D, F.R.S., and V Horsley.
- Case of Nerve-Splitting. By Surgeon-Major K. M'Leod, A.M., M.D.
- Cases of Inter-Cranial Tumour. By James Ross, M.D.
- Case of Alternate Hemiplegia, with Conjugate Deviation of the Eyes. By Alexander M. McAldowie, M.D.
- Crural Monoplegia—Limited Cortical Lesion of Opposite Hemisphere. By David Ferrier, M.D, F.R.S.

ABSTRACTS OF BRITISH AND FOREIGN JOURNALS:—
- Innervation des Vaisseaux Cutanés (Dastre et Morat). Etude sur la Physiologie des Nerfs des Muscles Striés (Tschierew) By A. Waller, M.D.
- Primary Athetosis (Gnauck). By W. J. Dodds, M D, D.Sc
- A Case Confirming Cerebral Localisation (Tamburini) Caizergue's Case of Cerebral Localisation. Lactic Acid as a Hypnotic By W. W. Ireland.
- Relations of Brain, Mind, and Higher Nerve Function. By W. G Thompson, M D.
- Traumatic Insanity. Bullet Wound of the Brain By Robert Lawson, M.B.

NOTICE.—The current volume of "Brain" is supplied to Subscribers post free for 14*s.* Any person wishing to purchase the complete set will, on the payment of 34*s*, receive the two vols. already published, and the parts of Vol. III. as they appear.

MACMILLAN & CO., London.

On the 1st of every Month.

TRIMEN'S JOURNAL OF BOTANY, BRITISH AND FOREIGN.

New Series. Edited by JAMES BRITTEN, F.L.S, British Museum.

CONTENTS.—Original Articles by leading Botanists.—Extracts, and Notices of Books and Memoirs.—Articles in Journals.—Botanical News — Proceedings of Societies

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

THE ZOOLOGIST: A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L S., F.Z S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

THE "HANSA"

Published since 1864 in Hamburg, is the only independent professional paper in Germany, dedicated exclusively to Maritime Objects. Essays, Critiques, Reviews, Reports, Advertisements. Strict eye kept upon the development of Maritime Affairs in every respect. Every second Sunday one Number in 4to at least, frequent supplements and drawings. SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

"A work of high value both to the student and to the tourist."—*Pall Mall Gazette.*

"The various stages of the narrative are made very intelligible to the reader by a great number of admirable drawings and diagrams, which exhibit with singular force and distinctness both the general effect of the whole scene and the special phenomena which Prof. Phillips desires to impress upon us. It is an extremely interesting as well as a thoroughly scientific book."—*Guardian.*

Author of "Reports on Injurious Insects," &c.

London: EDWARD STANFORD, 55, Charing Cross, S.W.

With 112 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18*s*.

"As affording a thoroughly reliable foundation for more advanced reading, Prof. Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"*To the solid ground*
Of Nature trusts the mind which builds for aye."—WORDSWORTH

NO. 550, VOL. 22] THURSDAY, MAY 13, 1880 [PRICE SIXPENCE

Registered as a Newspaper at the General Post Office.]

[All Rights are Reserved.

UNIVERSITY OF LONDON.

NOTICE IS HEREBY GIVEN, That the next Half-yearly Examination for MATRICULATION in this University will commence on MONDAY, the 21st of June, 1880. In addition to the Examination at the University, Provincial Examinations will be held at Owens College, Manchester; Queen's College, Liverpool; Queen's College, Birmingham; St. Cuthbert's College, Ushaw, Stonyhurst College; St Patrick's College, Carlow; University College, Bristol, The Yorkshire College, Leeds; The School of Science and Art, Newcastle-on-Tyne; and (*for Ladies only*) at the Ladies' College, Cheltenham.

Every Candidate is required to transmit his Certificate of Age to the Registrar (University of London, Burlington Gardens, London, W.) at least Fourteen Days before the commencement of the Examination.

ARTHUR MILMAN, M A, Registrar.

May 10th, 1880.

LONDON WATER SUPPLY.—A Public CONFERENCE to discuss this subject will be held by the SOCIETY OF ARTS on MONDAY, the 24th inst, and succeeding days. As soon as the arrangements are complete they will be published. Programmes, as soon as ready, can be had on application to the Secretary, Society of Arts, Adelphi, London, W.C.

By order,

H. TRUEMAN WOOD, Secretary.

Society's House, Adelphi, W.C.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S E.

The SUMMER SESSION will commence on May 1st. Students entering in the Summer are eligible to compete for the Natural Science Scholarships of £60 and £40 to be awarded in October. Special Classes are held to prepare for the Matriculation, Preliminary Scientific and 1st M.B. Examinations of the University of London. There are numerous Prizes and Scholarships, and all appointments are open to Students without charge. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars may be obtained from the Secretary, Dr. GILLESPIE.

W. M. ORD, M D., Dean.

EDISON'S PHONOGRAPH, with Stroh's Patent Rackwork for producing even, regular movements, articulates distinctly; a beautiful instrument. Price Thirty Guineas. Offers received.—JOHN W. CROCKER, 2, Codrington Street, Exeter.

HOFWYL SCHOOL, HOFWYL, near BERNE, SWITZERLAND, founded by EMANUEL DE FELLENBERG, offers sound instruction in the ancient, but especially in the modern, languages, mathematics, and natural sciences.

For Prospectus and further particulars apply to Dr. LEONHARD SCHMITZ, LL.D, 26, Belsize Park Gardens, London, N.W., or to the Head-Master, Mr. A. F. ANDREESEN, Hofwyl.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

THE SPECTRUM.

MR. JOHN BROWNING begs respectfully to inform the Scientific Public that he is now prepared to supply Prisms of Biniodide of Mercury and Potassium according to the method devised by Dr. Liveing. These Prisms, when furnished with plane and parallel sides, and the Mercury salt properly prepared, of the utmost density, give exquisite definition, with enormous dispersion, one Prism being equal in dispersive power to three or four Prisms of flint glass; their greatest dispersion being in the red end of the Spectrum.

The Price of these Prisms is from 36s. each.

PRICED LIST OF SPECTROSCOPES POST FREE.

Illustrated Catalogue of Spectroscopes for Six Stamps.

JOHN BROWNING,
63, STRAND, LONDON, W.C.

NEW ATHENÆUM CLUB, 26, Suffolk Street, Pall Mall, S.W., for Members of Scientific Societies and Graduates of Universities. Limited to 1,000 Members The fourth 250 Members to complete the Club are now being admitted Number of Members, May 4th, 1880, 902. J LOGAN LOBLEY, Secretary.

TO COLLECTORS OF CURIOSITIES, MUSEUMS, &c.—A Gentleman wishes to dispose of a fine specimen of a South American HAMMOCK, Maucaybo work, in the best style, full length, said to have been made for a chief's wife.—Apply to A. R. H., Gouldsmith's Library, Lower Sydenham, S.E.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra; Ground edged Slips, 5s. per gross; also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

TO CURATORS AND OTHERS.—W. H. SHRUBSOLE, F G S., Sheerness-on-Sea, offers for Sale, together or separately, a number of very choice and some unique specimens from the London Clay, including *Chelonia, Crocodilus, Palæophis, Argillarius longipennis, Aturia zic-zac,* Fish Crania, &c., &c. An inspection is invited.

WANTED, Clean Copies of NATURE, No. 472, for November 14, 1878. Address—Office of NATURE, 29, Bedford Street, Strand.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology, and every branch of Microscopy. Catalogue post free and gratis on application.

PARIS UNIVERSAL EXHIBITION, 1878.

Prize Medal awarded for Excellence, Variety, &c.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

MINERALOGY AND GEOLOGY.

COLLECTIONS OF 200 SPECIMENS IN CABINETS,

Specially adapted for Students and Teachers, price 42*s*.

Smaller Collections at same rate. These Collections are used with success by nearly all geological science teachers in the United Kingdom. Single Specimens and every requisite of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

See new Lists of Collections, new List of Apparatus, &c. Established 22 years in London.

MINERALOGY AND GEOLOGY.

Just received, the following Minerals for Chemical Purposes :—SHORLOMITE, RUTILE, ZIRCON, BERYL, ALLANITE, COLUMBITE, WITHERITE, CERITE, EUXENITE, THORITE, PHENAKITE.

Also Specimens of TOPAZ, Crystals of SENAMONTITE, BERYLS (terminated), GROSSULAR, ZIRCON, MICROLINE, NATIVE PLATINUM, ACMITE, PSEUDOMORPHOUS GARNET, GREEN WAVELLITE, CERUSSITE, NATIVE MERCURY, SODALITE, BROOKITE, PEROFSKITE, ARAGONITE, ALEXANDRITE, PROUSTITE.

BLOWPIPE CASES AND OTHER APPARATUS.

COLLECTIONS FOR STUDENT OR TEACHER,	from £2 2*s*.
ELEMENTARY COLLECTIONS,	from 4*s*.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,
With the Assistance of

FREDERICK BOND, F.Z.S. | JOHN A. POWER, M D.
EDWARD A. FITCH, F.L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

Now ready, price 3*s.* 6*d.*, Part IX. of

BRAIN:
A QUARTERLY JOURNAL OF NEUROLOGY.

EDITED BY
J. C. BUCKNILL, M.D., F.R.S., J. CRICHTON-BROWNE, M.D., LL.D., D. FERRIER, M.D., F.R.S., AND J. HUGHLINGS-JACKSON, M.D., F.R.S.

Contents.

Original Articles:—
- A Plea for the Neurotic Theory of Gout. By Dyce Duckworth, M.D. (Edin.).
- The Conditions of the Unipolar Stimulation in Physiology and Therapeutics. By A de Watteville, M.A., B.Sc.
- The Anatomy and Physiology of the Chorda Tympani Nerve. By Horatio R. Bigelow, M.D.
- On the Paralysis which results from Angular Curvature of the Spine. By John Duncan, M.D.
- On some Varieties of Cervical Paraplegia. By Thomas Buzzard, M.D.
- Distribution of the Arteries of the Spinal Cord. By James Ross, M.D.

Critical Digests and Notices of Books:—
- Nothnagel on the Regional Diagnosis of Diseases of the Brain. By D. Ferrier, M.D.
- Huxley on the Crayfish. An Introduction to the Study of Zoology. By F. Jeffrey Bell.
- Gowers on Pseudo-hypertrophic Muscular Paralysis. By Robert Saundby, M.D.
- The Index Medicus.
- Morris on Skin Diseases.

Clinical Cases.—
- Arrest of Development in the Left Upper Limb, in association with an extremely small Right Ascending Parietal Convolution. By H. Charlton Bastian, M.D., F.R.S., and V. Horsley.
- Case of Nerve-Splitting. By Surgeon-Major K. M'Leod, A.M., M.D.
- Cases of Inter-Cranial Tumour. By James Ross, M.D.
- Case of Alternate Hemiplegia, with Conjugate Deviation of the Eyes. By Alexander M. McAldowie, M.D.
- Crural Monoplegia—Limited Cortical Lesion of Opposite Hemisphere. By David Ferrier, M.D., F.R.S.

Abstracts of British and Foreign Journals:—
- Innervation des Vaisseaux Cutanés (Dustre et Morat). Etude sur la Physiologie des Nerfs des Muscles Striés (Tschierew). By A. Waller, M.D.
- Primary Athetosis (Gnauck). By W. J. Dodds, M.D., D.Sc.
- A Case Confirming Cerebral Localisation (Tamburini). Caizergue's Case of Cerebral Localisation. Lactic Acid as a Hypnotic. By W. W. Ireland.
- Relations of Brain, Mind, and Higher Nerve Function. By W. G. Thompson, M.D.
- Traumatic Insanity. Bullet Wound of the Brain. By Robert Lawson, M.B.

NOTICE.—The current volume of "Brain" is supplied to Subscribers post free for 14*s.* Any person wishing to purchase the complete set will, on the payment of 34*s.*, receive the two vols. already published, and the parts of Vol. III. as they appear.

MACMILLAN & CO., London.

Price 1*s.* Monthly.

London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

Established 1843.

THE YEAR'S ART:

A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE which have occurred during the year 1879, together with information respecting the events of the year 1880.

Compiled by MARCUS B. HUISH, LL.B.

"This little volume of statistics and information will be of service to many readers, and the compiler has done his work well."—*Pall Mall Gazette.*

"It contains a great deal of useful information arranged in a way which makes reference easy."—*Athenæum.*

"This new handbook supplies what has hitherto been a void in year-books, and deserves, nor can we doubt that it will obtain, a large share of popular support. . . . As far as we have been able to test Mr. Huish's volume, it admirably fulfils its purpose."—*John Bull.*

"Let us conclude this notice by heartily thanking Mr. Huish for his excellent handbook. It is sold at half-a-crown; we would willingly have given a guinea for it, and only regret it was not thought of sooner."—*Portfolio.*

MACMILLAN & CO., LONDON.

Office: 29, Bedford Street, Strand.

DIARY OF SOCIETIES.

LONDON

THURSDAY, MAY 13.

ROYAL SOCIETY, at 4.30.—On the Chemical Composition of Aleurone Grains: S. H. Vines.—Notice of Further Experimental Researches on the Time Relations of the Excitatory Process in the Ventricle of the Heart of the Frog: Dr. Sanderson, F.R.S., and F. J. M. Page.—Some Observations upon the Hydrolitic Ferments of the Pancreas and small Intestine: H. T. Brown and J. Heron.—A Preliminary Account of the Reduction of Observations on Strained Material, Leyden Jars, and Voltameters: Profs. Ayrton and Perry.—On the Ova of the *Echidna hystrix*: Prof. Owen, F.R.S.

MATHEMATICAL SOCIETY, at 8.—On Cremonian Congruences: Dr. Hirst, F.R.S.—On some Statical and Kinematical Theorems: Prof. Minchin.—Paper by Prof. Cayley, F.R.S.—On Binomial Biordinals: Sir James Cockle, F.R.S.

ROYAL INSTITUTION, at 3.—Light: Prof. Tyndall.

SOCIETY OF ARTS, at 8.—Optical Properties of Crystals: Prof. W. G. Adams.

FRIDAY, MAY 14.

ROYAL INSTITUTION, at 9.—Social Democracy in Germany: Lord Reay.

ASTRONOMICAL SOCIETY, at 8.

SOCIETY OF ARTS, at 8.—China and the Chinese: A. T. de la Couperie.

QUEKETT MICROSCOPICAL CLUB, at 8.

SATURDAY, MAY 15.

ROYAL INSTITUTION, at 3.—Dramatists before Shakespeare: Prof. Morley.

TUESDAY, MAY 18.

ROYAL INSTITUTION, at 3.—American Political Ideas: Mr. Fiske.

SOCIETY OF ARTS, at 8.—Madagascar: Rev. James Sibree, Jun.

WEDNESDAY, MAY 19.

METEOROLOGICAL SOCIETY, at 7.—Variations in the Barometric Weight of the Lower Atmospheric Strata in India: Prof. E. Douglas Archibald, M.A.—Winds and Weather experienced in the North Atlantic between lats. 30° and 50° during February and March, 1880: Charles Harding.—On the Meteorology of Mozufferpore, Tirhoot, for the year 1879: Charles N. Pearson.

CROYDON MICROSCOPICAL CLUB, at 8.30.

SOCIETY OF ARTS, at 8.—Trade Routes between England, Norway, and Siberia: Lieut. Temple.

THURSDAY, MAY 20.

CHEMICAL SOCIETY, at 8.—On the Oxidation of Peaty Matter: Lucy Holcrow and Dr. E. Frankland.—Discussion on Dr. Tidy's paper on River Water.

ROYAL INSTITUTION, at 3.—Buddhist Sacred Books: T. W. R. Davids.

SOCIETY OF ARTS, at 8.—Recent Advances in Photography: Capt. Abney.

FRIDAY, MAY 21.

ROYAL INSTITUTION, at 9.—Electricity *in transitu*: Dr. W. Spottiswoode.

SATURDAY, MAY 22.

ROYAL INSTITUTION, at 3.—The Dramatists before Shakespeare: Prof. H. Morley.

BRAIN:

A QUARTERLY JOURNAL OF NEUROLOGY.

EDITED BY

J. C. BUCKNILL, M D., F.R S, J. CRICHTON-BROWNE, M.D, LL.D., D. FERRIER, M.D, F.R S, AND J. HUGHLINGS-JACKSON, M.D., F.R.S.

Contents.

ORIGINAL ARTICLES:—
- A Plea for the Neurotic Theory of Gout. By Dyce Duckworth, M.D. (Edin.)
- The Conditions of the Unipolar Stimulation in Physiology and Therapeutics By A. de Watteville, M A., B Sc.
- The Anatomy and Physiology of the Chorda Tympani Nerve. By Horatio R. Bigelow, M.D.
- On the Paralysis which results from Angular Curvature of the Spine. By John Duncan, M.D
- On some Varieties of Cervical Paraplegia. By Thomas Buzzard, M.D.
- Distribution of the Arteries of the Spinal Cord. By James Ross, M.D.

CRITICAL DIGESTS AND NOTICES OF BOOKS:—
- Nothnagel on the Regional Diagnosis of Diseases of the Brain. By D. Ferrier, M.D
- Huxley on the Crayfish. An Introduction to the Study of Zoology. By F. Jeffrey Bell
- Gowers on Pseudo-hypertrophic Muscular Paralysis. By Robert Saundby, M.D.
- The Index Medicus
- Morris on Skin Diseases.

CLINICAL CASES:—
- Arrest of Development in the Left Upper Limb, in association with an extremely small Right Ascending Parietal Convolution By H. Charlton Bastian, M.D, F R.S, and V Horsley.
- Case of Nerve-Splitting By Surgeon-Major K. M'Leod, A M, M D.
- Cases of Inter-Cranial Tumour. By James Ross, M.D.
- Case of Alternate Hemiplegia, with Conjugate Deviation of the Eyes. By Alexander M. McAldowie, M D
- Crural Monoplegia—Limited Cortical Lesion of Opposite Hemisphere. By David Ferrier, M.D, F R.S.

ABSTRACTS OF BRITISH AND FOREIGN JOURNALS:—
- Innervation des Vaisseaux Cutanés (Dastre et Morat). Etude sur la Physiologie des Nerfs des Muscles Striés (Tschierew) By A. Waller, M D
- Primary Athetosis (Gnauck). By W. J. Dodds, M D, D.Sc.
- A Case Confirming Cerebral Localisation (Tamburini). Caizergue's Case of Cerebral Localisation. Lactic Acid as a Hypnotic. By W. W. Ireland.

MACMILLAN & CO., London.

CLARENDON PRESS PUBLICATIONS.

VESUVIUS. By Prof. PHILLIPS, F.R.S. With Maps and Illustrations. Crown 8vo. 10s. 6d.

CONTENTS—Vesuvius at Rest—In Action—In Eruption—In the 19th Century—Characteristic Phenomena of the Eruptions—Periods of Rest and Activity—Form and Structure—The Phlegræan Fields—Volcanic Energy—Minerals—Lava and Ashes—General Views Leading to a Theory of Volcanic Excitement—Appendix—Index.

"A work of high value both to the student and to the tourist."—*Pall Mall Gazette.*

"The various stages of the narrative are made very intelligible to the reader by a great number of admirable drawings and diagrams, which exhibit with singular force and distinctness both the general effect of the whole scene and the special phenomena which Prof. Phillips desires to impress upon us. It is an extremely interesting as well as a thoroughly scientific book."—*Guardian.*

DIAMONDS AND OTHER PRECIOUS STONES. Scientific opinion given as to GENUINENESS, PURITY, and VALUE—BRYCE WRIGHT, 90, Great Russell Street, London, Now publishing, in Crown 8vo. Price 2s 6d each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 100,000 Vols. of this series have been sold.

COWPER. By Goldwin Smith. Crown 8vo. 2s. 6d. [*Just ready.*

CHAUCER. By Prof. A. W. Ward. Crown 8vo. 2s. 6d.

BUNYAN. By J. A. Froude. Crown 8vo. 2s. 6d.
"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. Dowden. Crown 8vo. 2s 6d,
"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By Henry James. Crown 8vo. 2s 6d
"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By Mark Pattison. Crown 8vo. 2s 6d.
"Mr Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator*

JOHNSON. By Leslie Stephen. Crown 8vo. 2s. 6d.
"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay"—*Pall Mall Gazette.*

SCOTT. By R. H. Hutton. Crown 8vo. 2s. 6d.
"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. Morison. Crown 8vo. 2s. 6d.
"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. Symonds. Crown 8vo. 2s 6d.
"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. Huxley, F.R.S. Crown 8vo. 2s 6d.
"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity"—*Athenæum.*

GOLDSMITH. By William Black. Crown 8vo. 2s. 6d.
"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. Minto. Crown 8vo. 2s. 6d.
"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal Shairp. Crown 8vo. 2s. 6d.
"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the Dean of St. Paul's. Crown 8vo. 2s 6d.
"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By Anthony Trollope. Crown 8vo 2s. 6d
"Mr. Trollope' sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By John Morley. Crown 8vo. 2s. 6d.
"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

EARLY MAN in BRITAIN, and his PLACE in the TERTIARY PERIOD. By W. BOYD DAWKINS, F.R.S, Professor of Geology in Owens College, Manchester Medium 8vo, with numerous Illustrations. 25s.

MACMILLAN & CO., London.

SOME WORKS ON CHEMISTRY.

A TREATISE ON INORGANIC CHEMISTRY. With numerous Illustrations. By Profs. ROSCOE and SCHORLEMMER.

Vol. I.—The Non-metallic Elements. 8vo. 21*s.*
Vol. II., Part I. Metals. 8vo. 18*s.*
Vol. II., Part II. Metals. 8vo. 18*s.*

"Regarded as a treatise on the Non-Metallic Elements, there can be no doubt that this volume is incomparably the most satisfactory one of which we are in possession."—*Spectator.*

"It would be difficult to praise the work too highly. All the merits which we noticed in the first volume are conspicuous in the second. The arrangement is clear and scientific; the facts gained by modern research are fairly represented and judiciously selected; and the style throughout is singularly lucid."—*Lancet.*

A HISTORY OF CHEMICAL THEORY, from the Age of Lavoisier down to the Present Time. By AD. WURTZ. Translated by HENRY WATTS, F.R.S. Crown 8vo. 6*s.*

"The discourse as a *résumé* of chemical theory and research, unites singular luminousness and grasp. A few judicious notes are added by the translator."—*Pall Mall Gazette.*

"The treatment of the subject is admirable, and the translator has evidently done his duty most efficiently."—*Westminster Review.*

LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC AND ORGANIC. By HENRY E. ROSCOE, F.R.S., Professor of Chemistry in Owens College, Manchester. With numerous Illustrations and Cromo-litho of the Solar Spectrum, and of the Alkalies and Alkaline Earths. New Edition. Fcap. 8vo. 4*s.* 6*d.*

A SERIES OF CHEMICAL PROBLEMS, Prepared with Special Reference to the above. By T. E. THORPE, Ph.D., Professor of Chemistry in the Yorkshire College of Science, Leeds. Adapted for the preparation of Students for the Government, Science, and Society of Arts Examinations. With a Preface by Prof. ROSCOE. New Edition, with Key. 18mo. 2*s.*

THE OWENS COLLEGE JUNIOR COURSE OF PRACTICAL CHEMISTRY. By FRANCIS JONES, F.R.S.E., F.C.S., Chemical Master in the Grammar School, Manchester. With Preface by Prof. ROSCOE, and Illustrations. New Edition. 18mo. 2*s.* 6*d.*

QUESTIONS ON CHEMISTRY. A Series of Problems and Exercises in Inorganic and Organic Chemistry. By F. JONES, F.R.S.E., F.C.S. 18mo. 3*s.*

A MANUAL OF THE CHEMISTRY OF THE CARBON COMPOUNDS OR ORGANIC CHEMISTRY. By C. SCHORLEMMER, F.R.S., Lecturer in Organic Chemistry in Owens College, Manchester. 8vo. 14*s.*

"It appears to us to be as complete a manual of the metamorphoses of carbon as could be at present produced, and it must prove eminently useful to the chemical student."—*Athenæum.*

MACMILLAN AND CO., LONDON.

New Volume of "Nature Series."

THE YEAR'S ART:

A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE which have occurred during the year 1879, together with information respecting the events of the year 1880.

Compiled by MARCUS B. HUISH, LL.B.

"This little volume of statistics and information will be of service to many readers, and the compiler has done his work well."—*Pall Mall Gazette.*

"It contains a great deal of useful information arranged in a way which makes reference easy."—*Athenæum.*

"This new handbook supplies what has hitherto been a void in year-books, and deserves, nor can we doubt that it will obtain, a large share of popular support. . . . As far as we have been able to test Mr. Huish's volume, it admirably fulfils its purpose."—*John Bull.*

"Let us conclude this notice by heartily thanking Mr. Huish for his excellent handbook. It is sold at half-a-crown; we would willingly have given a guinea for it, and only regret it was not thought of sooner."—*Portfolio.*

MACMILLAN & CO., LONDON.

Just published in crown 8vo, price 3*s*. 6*d*.

THE SKIES AND WEATHER FORECASTS

OF ARATUS. Translated with Notes by E. POSTE, M.A., Oriel College, Oxford.

of Vertebrata, Crustacea, Mollusca, &c, all fine specimens, from Folkestone. At £12 per 1,000.—Z. Y., NATURE Office.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*
Office—377, High Street, Edinburgh
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

THE BEST FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture,

Devotes special attention to the discussions and proceedings of the Chamber of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to ensure delivery to country subscribers by the first post on Tuesday morning. Price 3*d.*, or prepaid, 15*s* a year post free.

12. Commercial and Arithmetical Examples, &c.
12a. Practising and Revising Copy-Books for Nos. 8 to 12.

Nos. 1 to 9, and 11, may be had with Goodman's Patent Sliding Copies. Large post 4to, price 6*d.* each.

By a simple device the copies, which are printed upon separate slips, are arranged with a movable attachment, by which they are adjusted so as to be directly before the eye of the pupil at all points of his progress. It enables him also to keep his own faults concealed, with perfect models constantly in view for imitation. Every experienced teacher knows the advantage of the slip copy, but its practical application has never before been successfully accomplished. This feature is secured exclusively to Macmillan's Copybooks under Goodman's patent.

An inspection of books written on the old plan, with copies at the head of the page, will show that the lines last written at the bottom are almost invariably the poorest. The copy has been too far from the pupil's eye to be of any practical use, and the result is a repetition and exaggeration of his errors.

MACMILLAN & CO., LONDON.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations. Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., and H. T. STAINTON, F.R.S.

THE ST. JAMES'S GAZETTE.

A NEW EVENING PAPER.

The circumstances under which this Journal is started were explained a few days since in a letter written by the late Editor of the *Pall Mall Gazette*, and published in the London Newspapers. After setting forth the reasons why he and the gentlemen associated with him in writing the *Pall Mall Gazette* were suddenly obliged to abandon that paper, Mr. Greenwood's letter concluded thus: "But we do not propose to allow our independent little paper to be extinguished. Its spirit resides in us, and it shall soon reappear in a new shape, and 'with all the latest improvements.'"

The ST. JAMES'S GAZETTE will be started in redemption of this promise, and its first number will be published on Monday, May 31.

The ST. JAMES'S GAZETTE will be associated with no political clique, and will studiously avoid the entanglement of party ties. Partisan journalism we understand, and are more than ready to allow that it may be carried on with usefulness and honour. But of partisan journalism there is abundance at all times; and if the public is to be well served by the Press, there should be something more in newspaper-writing than advocacy and antagonism. There should be independent criticism, unaffected by regard for the virtues, or even for the fortunes, of any minister or any party. The reproach of partisan journalism is twofold. In the first place, when this legislative measure or that course or policy comes under discussion, the good party writer is too apt to think of the constituencies first and the country afterwards; and in the competition of parties to "dish" each other, it sometimes happens that both think so much of the constituencies that the country is forgotten altogether. Now on these occasions—and they are not infrequent—an independent Press has its uses. In the next place, political partisanship is understood to justify the evasion, and even the suppression, of facts whenever they appear to be of a damaging or awkward character. But it is not for the public good that there should be any general evasion or suppression of facts; and yet there are times when the facts are almost as damaging or as awkward for the leaders of one party as for the chiefs of the other, and then it happens that the public is betrayed by a conspiracy of silence. The Press, to which the country looks for instruction, fails to do its duty, and yet is blameless according to all sound principles of political partisanship. Therefore it is that we choose to take an independent part in the discussion of political affairs, declining alliances which too often hamper criticism and stifle plain speaking precisely when the need of both is greatest.

But if we of the ST. JAMES'S GAZETTE have no preferences for Conservative or for Liberal wisdom, and shall probably be convicted on many occasions of making no more allowance for the follies of one party than of the other, we shall resume a certain course of duty with the comfortable assurance that here, at any rate, we run no risk of being charged with vacillation or inconsistency. These latter years have witnessed a new growth of Radical doctrine which is to English politics what the American weed is to English rivers. The preachers of this doctrine call it Advanced Liberalism, but it is, in fact, foreign to Liberalism, and in all its more important manifestations directly opposed thereto. The tyrannical temper of this School; their strange sympathy with despotism; their international policy, which appears to be drawn from Don Quixote and the Crusades; their Communist economy; their readiness to experimentalise in irrevocable legislation of the gravest order,—mark them off as a new and dangerous party in English politics; and to this School of Radicalism we shall offer at all times a vigilant and determined opposition.

From this brief Advertisement it will be seen that the writers in the ST. JAMES'S GAZETTE propose to continue, in the discussion of political affairs, the course of conduct which is expected of them. In LITERATURE, in ART, in all that should minister to the sweetness, the tranquillity, and the adornment of life, enough to say that it will not be our business to encourage the fantastic egotisms and the obtrusive insincerities of which there is too much in these days.

It only remains to be said that the ST. JAMES'S GAZETTE is equipped for its enterprise by men whose sole desire and intention in the matter is that what they conceive to be honest, independent, and useful journalism shall not be silenced. It seemed to them that what had been destroyed should be promptly and firmly re-established; and since, as we have abundant reason to know and be grateful for, this feeling is shared by many thousands of Her Majesty's subjects, we start with every confidence in the success we mean to merit.

The First Number of the ST. JAMES'S GAZETTE, a New Evening Paper, will appear on MONDAY, May 31.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25.

PRESIDENT-ELECT.

ANDREW CROMBIE RAMSAY, Esq., LL.D., F.R.S., V.P.G.S., Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section........................." Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the ASSISTANT-SECRETARY, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be OPENED on the 1st of OCTOBER next, with an INTRODUCTORY LECTURE by Dr. T. H. HUXLEY, F.R.S.

The CLASSES for STUDENTS will COMMENCE on TUESDAY, the 5th of October.

The COURSE OF INSTRUCTION, as at present arranged, includes Mathematics (Prof. M. J. M. Hill, M.A.), Chemistry (Prof. W. A. Tilden, D.Sc. Lond., F.R.S.), Physics (Prof. J. H. Poynting, M.A., B.Sc. Lond.), and Biology (Prof. T. W. Bridge, M.A., F.Z.S.). The Course is designed to prepare Students for the Degrees of B.Sc. and D.Sc. of the University of London.

Information as to the terms of admission and the arrangement of classes may be obtained on application to Mr. S. ALLPORT, Curator, at the College, Edmund Street, Birmingham.

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, May 26, 1880.

ZOOLOGICAL SOCIETY'S GARDENS, REGENT'S PARK.

The First DAVIS LECTURE will be given by Prof. W. H. FLOWER, LL.D., F.R.S., President of the Society, in the Lecture-room in the Society's Gardens, Regent's Park, on THURSDAY, June 3rd, at 5 o'clock p.m. Subject, "Teeth."

BROWNING'S MICROSCOPES.

The MODEL MICROSCOPE, made expressly for class demonstration, has rack and fine adjustments to the body, large stage fitted with universal stage motions, removable stage fittings for apparatus, revolving diaphragm, A or B eye-pieces, and 1-in. and ¼-in. combined objectives of my own manufacture.

PRICE £5 10s. 0d.

Price List of Microscopes Free.

Illustrated Catalogue of Microscopes with 41 Illustrations, 10 whole page engravings, post free 7 stamps.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

Established 1843.

HOLLOWAYS OINTMENT A CERTAIN REMEDY

For BAD BREASTS, OLD WOUNDS, and SORES. If effectually rubbed on the Neck and Chest, it cures SORE THROATS, BRONCHITIS, COUGHS and COLDS; and for GOUT, RHEUMATISM, and all Skin Diseases it is unequalled.

LA SEMAINE FRANÇAISE: a Weekly

Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3*d*., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Française pour l'Angleterre : Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½*d*., en timbres poste Abonnement franco par la poste—un an, 15*s* 2*d*.; six mois, 7*s*. 7*d*. Prix 3*d*., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

MACMILLAN & CO, LONDON.

With 112 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18*s*.

"As affording a thoroughly reliable foundation for more advanced reading, Prof. Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO, LONDON.

DIAMONDS AND OTHER PRECIOUS

STONES. Scientific opinion given as to GENUINENESS, PURITY, and VALUE.—BRYCE WRIGHT, 90, Great Russell Street, London,

11 AND 12, BEAK STREET, REGENT STREET, W.

IMPROVED HOLTZ ELECTRICAL MACHINES, with 4 to 24 Plates. Immediately available in any condition of the atmosphere.
LADD'S DYNAMO-MAGNETO MACHINE and GRAMME'S MAGNETO-ELECTRIC MACHINE for Laboratory use.

Physical Apparatus of every Description.

ILLUSTRATED CATALOGUE, SIXPENCE.

STANDARD AND OBSERVATORY TIMEKEEPERS.

TRADE DENT MARK MANUFACTURED BY E. DENT & CO. TRADE DENT MARK

	Guineas.
Standard Clock, suitable for Private Residences in Town or Country, or Public Institutions, beating seconds and going eight days with once winding; in carved and decorated oak or mahogany case ... ... from	35
(*a*) The same, but going one month with once winding ... ... from	40
Standard Observatory Mean-time Clock	80
(*a*) The same, but furnished with electrical contact apparatus with eccentric screw adjustments for dropping a time ball, or transmitting hourly signals	92
Standard Observatory Sidereal Clock	80
(*a*) The same, but furnished with electrical contact apparatus with fine vertical and horizontal screw adjustments for transmitting seconds, currents for controlling other clocks, &c.	95
(*b*) The same, but arranged to omit the current at every 60th second, for pricking on chronograph barrel, &c.	97

	Guineas.
Standard Observatory Clock, of the most refined construction, with barometric compensation, &c. ...	160
(*a*) The same, with Sir Geo. Airy's escapement ...	170
(*b*) The same, with M. Leverrier's electrical contact system	200

The New Standard Clock (the primary standard timekeeper of the United Kingdom) of the Royal Observatory, Greenwich, was constructed by E. Dent & Co., and precisely similar instruments are now being made for the Royal Observatories of Spain and Belgium. Standard Clocks of less refined construction for the Observatories of Edinburgh (Royal), Dunsink (Royal Irish), Oxford (University), Pulkowa (Russian Imperial), Geneva (National Swiss); and many others, Foreign and Colonial, have been manufactured.

Galvanic Chronographic Apparatus, for registering the time of occurrence of transits and other astronomical phenomena ... ... from	120

The Great Galvanic Chronograph of the Royal Observatory, Greenwich, and the still more powerful Apparatus for the Royal Observatory, Brussels, and other smaller ones for other Observatories were constructed by E. Dent & Co.

GLASGOW NAVAL AND MARINE ENGINEERING EXHIBITION.

Chairman—The Hon. The Lord Provost of Glasgow

An EXHIBITION of Models, Material, and Apparatus connected with Shipbuilding, Marine Engineering, and Navigation will be opened in the Corporation Galleries, Glasgow, in NOVEMBER next for a period of Six Months. There will be a Department for Artisans' Work, in which Prizes for various classes of Models, Inventions, and Apparatus will be awarded. The Exhibition is promoted by a Joint Committee of the Town Council of Glasgow and of the Shipbuilders and Marine Engineers of the Clyde.

Further information, and forms of application for space, may be obtained from the Secretary,

JAS. PATON.

Corporation Galleries, Glasgow, 21st May, 1880.

PRACTICAL GEOLOGY.—A well-known

Investigator and Author (London Doctor of Science) proposes in August to conduct a CLASS to the Northern Highlands for the Study of the Older Rocks.—For particulars address Doctor of Science, Ethelbert House, New Wimbledon, S W.

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be OPENED on the 1st of OCTOBER next, with an INTRODUCTORY LECTURE by Dr. T. H. HUXLEY, F R.S

The CLASSES for STUDENTS will COMMENCE on TUESDAY, the 5th of October

The COURSE OF INSTRUCTION, as at present arranged, includes Mathematics (Prof. M. J M Hill, M.A), Chemistry (Prof. W. A. Tilden, D.Sc. Lond, F.R S), Physics (Prof. J. H. Poynting, M.A, B.Sc. Lond.), and Biology (Prof. T. W. Bridge, M.A., F Z.S). The Course is designed to prepare Students for the Degrees of B.Sc. and D.Sc of the University of London.

Information as to the terms of admission and the arrangement of classes may be obtained on application to Mr. S. Allport, Curator, at the College, Edmund Street, Birmingham.

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, May 26, 1880.

ZOOLOGICAL SOCIETY'S GARDENS, REGENT'S PARK.

The next DAVIS LECTURE will be given by Prof. MIVART, F.R S., in the Lecture-room in the Society's Gardens, Regent's Park, on THURSDAY, June 10th, at 5 o'clock p.m. Subject, "Cats."

UNIVERSITY OF EDINBURGH.

CHEMICAL LABORATORY

The Office of LECTURER and SECOND LABORATORY ASSISTANT will be VACANT at the end of the present Summer Session.

Applications, accompanied by a sketch of the Applicant's previous history, and reference to two Chemists of eminence, will be received by Prof. Crum Brown until July 7th, 1880

MANCHESTER GRAMMAR SCHOOL.—

Wanted, an ASSISTANT for the Chemical Laboratory. Duties to commence September 1st —Further particulars on application to S. H. Hodson, Clerk and Receiver.

BROWNING'S MICROSCOPES.

The "COMPLETE" MICROSCOPE, with rack and fine adjustment to body, mechanical motions to stage, removable fittings for apparatus, revolving diaphragm with 3 apertures, A or B eyepiece, 1 in. 16° and ¼ in. 75° objectives, of which the performance will be guaranteed.

PRICE £7 10s. 0d.

Price List of Microscopes Free.

A New Edition of the Illustrated Catalogue of Microscopes, with 41 Illustrations, 10 whole page engravings, post free, 7 stamps.

BROWNING'S new Cheap Series of high-power Objectives, ¼-in. 80°, £2 7s. 6d., ⅛-in. 90°, £2 12s. 6d, [illegible]-in 95°, £3 5s 0d.

JOHN BROWNING,

Optical and Physical Instrument Maker to H.M. Government, the Royal Society, the Royal Observatories of Greenwich, Edinburgh, &c., &c.

63, STRAND, LONDON, W.C.

Factory—Southampton Street and Exeter Street, London.

Prize Medal, 1862. Established 100 Years.

Telescopes, Spectroscopes, Opera Glasses, &c., &c.

SUNSHINE RECORDER,

Of the form adopted by the Meteorological Council of the Royal Society, and supplied to more than thirty of their Stations, as well as to several private Observatories.

JORDAN'S GLYCERINE BAROMETER,

In which the Inch of the ordinary Barometer is expanded to nearly Eleven Inches, and which is in successful use at the Kew Observatory, at the *Times* Office, the Geological Museum, Jermyn Street, and other places.

For information, cost, &c., apply to R J Lecky, care of Kirkland, Cope, and Co, 23, Salisbury Street, Strand, London

---

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

PHILOSOPHICAL TRANSACTIONS.—

Any Fellow of the Royal Society not requiring his Copy of Phil. Trans., and willing to dispose of it year by year as published, at Fellows' prices, will oblige by communicating with the Secretaries of the "Bristol Museum and Library."—Wanted, Vol. 168, and all succeeding volumes.

FOR SALE, a Perfectly New Set of the

MONTHLY MICROSCOPICAL SOCIETY'S JOURNAL, in 18 vols., cloth, at one-third of the original price —Apply, J. W. P. Edwards, 10, St. Werburgh Street, Chester.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

CORRECTED NOTICE.

UNIVERSITY OF EDINBURGH.

CHEMICAL LABORATORY

The Office of LECTURE and SECOND LABORATORY ASSISTANT will be VACANT at the end of the present Summer Session.

Applications, accompanied by a sketch of the Applicant's previous history, and reference to two Chemists of eminence, will be received by Prof. CRUM BROWN until July 7th, 1880

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25.

PRESIDENT-ELECT.

ANDREW CROMBIE RAMSAY, ESQ., LL.D., F.R.S., V.P.G.S., Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section............................" Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the ASSISTANT-SECRETARY, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

GLASGOW NAVAL AND MARINE ENGINEERING EXHIBITION.

Chairman—The HON. THE LORD PROVOST OF GLASGOW.

An EXHIBITION of Models, Material, and Apparatus connected with Shipbuilding, Marine Engineering, and Navigation will be opened in the Corporation Galleries, Glasgow, in NOVEMBER next for a period of Six Months. There will be a Department for Artisans' Work, in which Prizes for various classes of Models, Inventions, and Apparatus will be awarded. The Exhibition is promoted by a Joint Committee of the Town Council of Glasgow and of the Shipbuilders and Marine Engineers of the Clyde.

Further information, and forms of application for space, may be obtained from the Secretary,

JAS. PATON.

Corporation Galleries, Glasgow, 21st May, 1880.

BROWNING'S MICROSCOPES.

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be OPENED on the 1st of OCTOBER next, with an INTRODUCTORY LECTURE by Dr. T. H. HUXLEY, F.R.S.

The CLASSES for STUDENTS will COMMENCE on TUESDAY, the 5th of October.

The COURSE OF INSTRUCTION, as at present arranged, includes Mathematics (Prof. M. J. M. Hill, M.A.), Chemistry (Prof. W. A. Tilden, D.Sc. Lond., F.R.S.), Physics (Prof. J. H. Poynting, M.A., B.Sc. Lond.), and Biology (Prof. T. W. Bridge, M.A., F.Z.S.). The Course is designed to prepare Students for the Degrees of B.Sc. and D.Sc. of the University of London.

Information as to the terms of admission and the arrangement of classes may be obtained on application to Mr. S. ALLP[illegible]rator, at the College, Edmund Street, Birmingham.

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, May 26, 1880.

ZOOLOGICAL SOCIETY'S GARDENS, REGENT'S PARK.

The next DAVIS LECTURE will be given by Prof. W. K. PARKER, F.R.S., in the Lecture-room in the Society's Gardens, Regent's Park, on THURSDAY, June 17th, at 5 o'clock p.m. Subject, "Tadpoles."

MANCHESTER GRAMMAR SCHOOL.—Wanted, an ASSISTANT for the Chemical Laboratory. Duties to commence September 1st.—Further particulars on application to S. H. HODSON, Clerk and Receiver.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48B, Tollington Road, Holloway, London, N.

JOHN FISKE, Esq., will REPEAT the THREE LECTURES recently delivered at the Royal Institution, on the EVOLUTION OF AMERICAN POLITICAL IDEAS as viewed from the standpoint of Universal History, at SOUTH PLACE INSTITUTE, FINSBURY, on the Evenings of JUNE 22, 24, and 25, at 8 o'clock. Prof HUXLEY will preside at the first Lecture. Fee for the Course, 2s. 6d., Single Lecture, 1s. Syllabus and Tickets may be obtained at the Institute on the evenings of the Lectures, or upon application by post to the Hon. Sec. CONRAD THIES, 76, Graham Road, Hackney, E.

The POST of ASTRONOMICAL ASSISTANT at Birr Castle is VACANT. Application to be made to the EARL OF ROSSE, by letter, at 25, Chesham Place, S.W., up to July 20, afterwards at Birr Castle, Parsonstown, Ireland. A taste for drawing by eye, a knowledge of the departments of Physics which bear on Astronomy, and of the computations required for reduction of simple Astronomical and Meteorological Observations, is desirable

---

HOFWYL SCHOOL, HOFWYL, near BERNE, SWITZERLAND, founded by EMANUEL DE FELLENBERG, offers sound instruction in the ancient, but especially in the modern, languages, mathematics, and natural sciences.

For Prospectus and further particulars apply to Dr. LEONHARD SCHMITZ LL.D., 26, Belsize Park Gardens, London, N.W., or to the Head-Master, Mr. A. F. ANDRESEN, Hofwyl.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry All the work practical.

PRACTICAL GEOLOGY.—A well-known Investigator and Author (London Doctor of Science) proposes in August to conduct a CLASS to the Northern Highlands for the Study of the Older Rocks.—For particulars address DOCTOR OF SCIENCE, Ethelbert House, New Wimbledon, S W.

FOR SALE.—A fine and well-preserved Specimen of the DEAL-FISH, caught at Holkham, October, 1879—For full particulars, apply to A NAPIER, Holkham, Norfolk

---

SUNSHINE RECORDER,

Of the form adopted by the Meteorological Council of the Royal Society, and supplied to more than thirty of their Stations, as well as to several private Observatories.

JORDAN'S GLYCERINE BAROMETER,

In which the Inch of the ordinary Barometer is expanded to nearly Eleven Inches, and which is in successful use at the Kew Observatory, at the *Times* Office, the Geological Museum, Jermyn Street, and other places.

For information, cost, &c, apply to R J LECKY, care of Kirkland, Cope, and Co, 23, Salisbury Street, Strand, London

---

R. C. ANDERSON'S PATENT GALVANIC BATTERIES, Powerful and Constant On view, working the Electric Light, and our 18-inch Spark Induction Coil, daily from 3 p m. Prices and full particulars, post free

DALE & CRAMPTON, Manufacturing Electricians (Sole Makers),
4, Little Britain, E.C.

PAR SUITE DE DÉCÈS A VENDRE.

Une magnifique collection particulière d'INSTRUMENTS et APPAREILS de PHYSIQUE, de MÉCANIQUE, et de TÉLÉGRAPHIE, ainsi qu'une collection complète des CORPS-SIMPLES, de PRODUITS CHIMIQUES, CRISTAUX, MINÉRAUX, &c.

Tous les appareils sont neufs, et sortent des ateliers de construction les plus renommés d'Angleterre, de France, et d'Allemagne.

Leur valeur est de £2,700.

Pour le catalogue et tous autres renseignements, s'adresser à Mr. J. VANDEVYVER, rue de la Santé, 9, à Anvers, Belgique.

MINERALOGY AND GEOLOGY.

COLLECTIONS OF 200 SPECIMENS IN CABINETS,

Specially adapted for Students and Teachers, price 42s.

Smaller Collections at same rate. These Collections are used with success by nearly all geological science teachers in the United Kingdom. Single Specimens and every requisite of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

> "*To the solid ground*
> *Of Nature trusts the mind which builds for aye.*"—WORDSWORTH

No. 556, Vol. 22] THURSDAY, JUNE 24, 1880 [Price Sixpence

Registered as a Newspaper at the General Post Office.]

All Rights are Reserved.

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be OPENED on the 1st of OCTOBER next, with an INTRODUCTORY LECTURE by Dr. T H. HUXLEY, F R S

The CLASSES for STUDENTS will COMMENCE on TUESDAY, the 5th of October

The COURSE OF INSTRUCTION, as at present arranged, includes Mathematics (Prof M J M Hill, M A). Chemistry (Prof W A Tilden, D Sc Lond, F R S), Physics (Prof J. H. Poynting, M.A, B Sc Lond.), and Biology (Prof. T. W. Bridge, M A, F Z S). The Course is designed to prepare Students for the Degrees of B.Sc. and D Sc. of the University of London

Information as to the terms of admission and the arrangement of classes may be obtained on application to Mr. S. Allport, Curator, at the College, Edmund Street, Birmingham

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, May 26, 1880.

GLASGOW NAVAL AND MARINE ENGINEERING EXHIBITION.

Chairman—The Hon The Lord Provost of Glasgow

An EXHIBITION of Models, Material, and Apparatus connected with Shipbuilding, Marine Engineering, and Navigation will be opened in the Corporation Galleries, Glasgow, in NOVEMBER next for a period of Six Months. There will be a Department for Artisans' Work, in which Prizes for various classes of Models, Inventions, and Apparatus will be awarded The Exhibition is promoted by a Joint Committee of the Town Council of Glasgow and of the Shipbuilders and Marine Engineers of the Clyde.

Further information, and forms of application for space, may be obtained from the Secretary,

JAS. PATON.

Corporation Galleries, Glasgow, 21st May, 1880.

SOUTH LONDON SCHOOL OF PHARMACY.

Special advantages are offered to Gentlemen during the Vacation, commencing the middle of July, in every branch of Practical Chemistry as applied to Manufactures, Agricultural and Commercial Products, Water, Gas, Food, &c.

For terms, personal or by letter, W Baxter, Secretary, Central Public Laboratory, Kennington Cross, S.E.

The POST of ASTRONOMICAL ASSISTANT at Birr Castle is VACANT. Application to be made to the Earl of Rosse, by letter, at 25, Chesham Place, S W, up to July 20, afterwards at Birr Castle, Parsonstown, Ireland. A taste for drawing by eye, a knowledge of the departments of Physics which bear on Astronomy, and of the computations required for reduction of simple Astronomical and Meteorological Observations, is desirable

SUNSHINE RECORDER,

Of the form adopted by the Meteorological Council of the Royal Society, and supplied to more than thirty of their Stations, as well as to several private Observatories.

JORDAN'S GLYCERINE BAROMETER,

In which the Inch of the ordinary Barometer is expanded to nearly Eleven Inches, and which is in successful use at the Kew Observatory, at the *Times* Office, the Geological Museum, Jermyn Street, and other places.

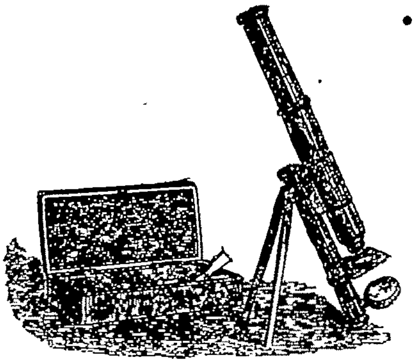
For information cost, &c., apply to R J Lecky, care of Kirkland, Cope, and Co, 23, Salisbury Street, Strand, London

BROWNING'S POCKET MICROSCOPE.

The New Pocket or Field Microscope, on Firm Folding Brass Tripod Stand, with fine Adjustment, 1-inch Objective, Large Field Eye-piece, Hand-pliers, &c.; height when set up, 10 inches; dimensions, packed in Morocco Case, 5¼ inches long. Price £1 11*s*. 6*d*.

Or with 1-inch and 2-inch Objectives, Stage, Forceps, Stage Plate, and Dipping Tube, £2 2*s*.

List of Microscopes sent free.



Illustrated Catalogue of Microscopes, with 41 Illustrations, 10 whole page Illustrations, sent for Six Stamps.

JOHN BROWNING,

Optical and Physical Instrument Maker to Her Majesty's Government, the Royal Society, the Royal Observatories of Greenwich, Edinburgh, &c., &c.,

63, STRAND, LONDON, W.C.

Factory—Southampton Street and Exeter Street, London.

Prize Medal, 1862. Established 100 Years.

Telescopes, Spectroscopes, Opera Glasses, &c., &c.

BURLINGTON HOUSE,

RICHMOND HILL, SURREY

Mr. A N. FYNES-CLINTON, M A., late Junior Student of Christ Church, Oxford, Graduate in Classical Honours, and Mr R. HAWKINS, M.A., late Scholar of Corpus Christi College, Cambridge, Graduate in the Mathematical Tripos, receive Sons of Gentlemen from 8 to 15 years of age to prepare for the Public Schools, &c.

There is a separate class-room for each class, and the bed-rooms are large and lofty. The household arrangements are under the care of Mrs. HAWKINS

Successes this year include a First Entrance Exhibition at Westminster.

Prospectuses and Testimonials will be forwarded on application.

ZOOLOGICAL SOCIETY'S GARDENS,

REGENT'S PARK.—The next DAVIS LECTURE will be given by J. E. HARTING, Esq., in the Lecture Room in the Society's Gardens, Regent's Park, on THURSDAY, June 24, at 5 o'clock p.m. Subject: "Hawks and Hawking."

MANCHESTER GRAMMAR SCHOOL.—Wanted, an ASSISTANT for the Chemical Laboratory. Duties to commence September 1st—Further particulars on application to S. H. Hodson, Clerk and Receiver.

DIAMONDS AND OTHER PRECIOUS STONES. Scientific opinion given as to GENUINENESS, PURITY, and VALUE—Bryce Wright, 90, Great Russell Street, London.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

HOFWYL SCHOOL, HOFWYL, near BERNE, SWITZERLAND, founded by EMANUEL DE FELLENBERG, offers sound instruction in the ancient, but especially in the modern, languages, mathematics, and natural sciences.

For Prospectus and further particulars apply to Dr. LEONHARD SCHMITZ LL.D., 26, Belsize Park Gardens, London, N.W., or to the Head-Master, Mr. A. F. ANDRESEN, Hofwyl.

PRACTICAL GEOLOGY.—A well-known Investigator and Author (London Doctor of Science) proposes in August to conduct a CLASS to the Northern Highlands for the Study of the Older Rocks.—For particulars address DOCTOR OF SCIENCE, Ethelbert House, New Wimbledon, S W.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address:—CASTLETON, *viâ* SHEFFIELD.

PAR SUITE DE DÉCÈS A VENDRE.

Une magnifique collection particulière d'INSTRUMENTS et APPAREILS de PHYSIQUE, de MÉCANIQUE, et de TÉLÉGRAPHIE, ainsi qu'une collection complète des CORPS-SIMPLES, de PRODUITS CHIMIQUES, CRISTAUX, MINÉRAUX, &c.

Tous les appareils sont neufs, et sortent des ateliers de construction les plus renommés d'Angleterre, de France, et d'Allemagne.

Leur valeur est de £2,700.

Pour le catalogue et tous autres renseignements, s'adresser à Mr. J. VANDEVYVER, rue de la Santé, 9, à Anvers, Belgique.

MINERALOGY AND GEOLOGY.

COLLECTIONS OF 200 SPECIMENS IN CABINETS,

Specially adapted for Students and Teachers, price 42*s*.

Smaller Collections at same rate. These Collections are used with success by nearly all geological science teachers in the United Kingdom. Single Specimens and every requisite of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

See new Lists of Collections, new List of Apparatus, &c. Established 22 years in London.

THOMAS D. RUSSELL'S

NATURAL HISTORY STORES,

48, ESSEX STREET, STRAND, W.C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro- Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Edited by JOHN T. CARRINGTON,

With the Assistance of

FREDERICK BOND, F Z.S.	JOHN A. POWER, M D
EDWARD A. FITCH, F L S.	J JENNER WEIR, F.L.S.

F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science, on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories, occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

On the 1st of every Month.

TRIMEN'S JOURNAL OF BOTANY,

BRITISH AND FOREIGN.

New Series. Edited by JAMES BRITTEN, F.L.S., British Museum.

CONTENTS.—Original Articles by leading Botanists—Extracts, and Notices of Books and Memoirs.—Articles in Journals.—Botanical News.—Proceedings of Societies

Price 1*s.* 3*d.* Subscription for One Year, payable in advance, 12*s.*

London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

THE "HANSA"

Published since 1864 in Hamburg, is the only independent professional paper in Germany, dedicated exclusively to Maritime Objects. Essays, Critiques, Reviews, Reports, Advertisements. Strict eye kept upon the development of Maritime Affairs in every respect. Every second Sunday one Number in 4to at least; frequent supplements and drawings. Subscription at any time; preceding numbers of the year furnished subsequently. Price 12*s.* for twelve months. Advertisements 4*d.* a line, widely spread by this paper; considerable abatement for 3, 6, 12 months' insertion. Business Office: Aug. Meyer and Dieckmann, Hamburg, Alterwall 28. Edited by W. v. FREEDEN, M.R., Hamburg, Alexander Street, 8.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.

REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.

The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests, Subscription, 16*s.* 6*d.* per annum, post free, dating from any quarter-day. Single Copies 1*s.* each. Registered for transmission abroad.

Offices—5, Bond Court, Walbrook, London, E.C.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations

Conducted by J. W. DOUGLAS, R MCLACHLAN, F.R.S., E. C. RYE, F.Z.S, and H. T. STAINTON, F R S

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year

Vols I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s.* each; the succeeding vols. may be had separately or together, at 7*s.* each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

NORTH BRITISH AGRICULTURIST is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*

Office—377, High Street, Edinburgh

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology, habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles, British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

MACMILLAN & CO., LONDON.

The MORPHOLOGY of the SKULL. By W. K. PARKER, F.R.S., Hunterian Professor, Royal College of Surgeons, and G. T. BETTANY, B.Sc, Lecturer on Botany in Guy's Hospital Medical School. Illustrated. Crown 8vo. 10*s.* 6*d.*

MACMILLAN & CO., London.

LIGHTNING CONDUCTORS:

THEIR
HISTORY, NATURE, AND MODE OF APPLICATION.
By RICHARD ANDERSON, F.C.S., F G.S.,
Member of the Society of Telegraph Engineers, Assoc. Inst. C E
With numerous Illustrations

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy*

London: E. & F. N. SPON, 46, Charing Cross.
New York 446, Broome Street 1880

NEW WORKS PUBLISHED BY

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 557, Vol. 22] THURSDAY, JULY 1, 1880 [Price Sixpence

Registered as a Newspaper at the General Post Office.]

All Rights are Reserved.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25.

President-Elect.

ANDREW CROMBIE RAMSAY, Esq., LL.D., F.R.S., V.P.G.S.,
Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section........................" Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the Secretaries in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the Assistant-Secretary, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. Ord, M.D., Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examination of the University of London. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr Gillespie.

W. M. ORD, M.D., Dean.

KING EDWARD'S SCHOOL,

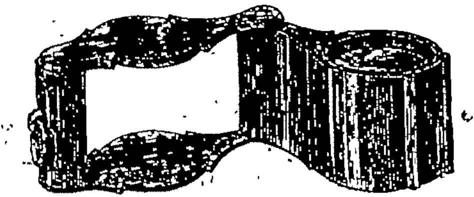
BIRMINGHAM.

The post of SCIENCE MASTER in the High School is vacant. Salary £250, with an annual increase up to £400.

Applications, accompanied by not more than three testimonials, should be sent in, not later than the 17th July, 1880, to the Secretary, King Edward's School, Birmingham, from whom further particulars may be obtained.

King Edward's School, 22nd June, 1880.

BROWNING'S PLATYSCOPIC LENS.



Engraved Real Size.

A NEW ACHROMATIC COMBINATION,

COMBINING THE DEFINITION OF A MICROSCOPE WITH THE PORTABILITY OF A POCKET LENS.

The Platyscopic Lens is invaluable to botanists, mineralogists, or entomologists, as it focusses about three times as far from the object as the Coddington Lenses. This allows opaque objects to be examined easily.

The Platyscopic Lens is made of three degrees of power, magnifying respectively, 15, 20, and 30 diams.; the lowest power, having the larges field, is the best adapted for general use.

The Lenses are set in Ebonite Cells, and mounted in Tortoiseshell Frames.

Price of the Platyscopic Lens, mounted in Tortoiseshell, magnifying either 15, 20, *or* 30 *diameters*, £1 5*s*.

Illustrated description sent free.

JOHN BROWNING, 63, Strand, London, W.C.

BURLINGTON HOUSE,

RICHMOND HILL, SURREY

Mr. A. N. FYNES-CLINTON, M.A., late Junior Student of Christ Church, Oxford, Graduate in Classical Honours, and Mr R. HAWKINS, M.A., late Scholar of Corpus Christi College, Cambridge, Graduate in the Mathematical Tripos, receive Sons of Gentlemen from 8 to 15 years of age to prepare for the Public Schools, &c.

There is a separate class-room for each class, and the bed-rooms are large and lofty. The household arrangements are under the care of Mrs. HAWKINS.

Successes this year include a First Entrance Exhibition at Westminster.

Prospectuses and Testimonials will be forwarded on application.

ZOOLOGICAL SOCIETY'S GARDENS,

REGENT'S PARK.—The next DAVIS LECTURE will be given by Prof. T. H. HUXLEY, F.R.S., in the Lecture Room in the Society's Gardens, Regent's Park, on THURSDAY, July 1, at 5 o'clock p.m. Subject: "Cuttle-fishes and Squids."

GERMAN SCIENCE TEACHER.—A Son of Dr. Hermann Muller, of the Lippstadt Realschule, and well known to the readers of Nature, desires to obtain a post in a good English school or college. Herr Muller, Jun., has acquired from a Prussian Board of Examination the qualification to teach Mathematics, Physics, Chemistry, and Natural History, and has been for three years a teacher in the same school as his father. Herr Müller is desirous of becoming more thoroughly acquainted with the English language and English educational institutions, and therefore would be satisfied with a moderate salary. Apply to Dr. Hermann Muller, Oberlehrer, Lippstadt, Germany.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

ZOOLOGICAL SOCIETY OF LONDON.—Water-fowl and other Duplicates for Sale.—Apply to the SUPERINTENDENT, Zoological Society's Gardens, Regent's Park, N.W.

HOFWYL SCHOOL, HOFWYL, near BERNE, SWITZERLAND, founded by EMANUEL DE FELLENBERG, offers sound instruction in the ancient, but especially in the modern, languages, mathematics, and natural sciences.

For Prospectus and further particulars apply to Dr. LEONHARD SCHMITZ LL.D., 26, Belsize Park Gardens, London, N.W., or to the Head-Master, Mr. A. F. ANDRESEN, Hofwyl.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

THE LONDON LIBRARY,

12, ST. JAMES'S SQUARE, S.W.

President.
Thomas Carlyle, Esq.

Trustees.
Earl of Carnarvon, Lord Houghton, Earl of Rosebery.

Committee.
Sir James Alderson, F. W. Burton, Esq., Rev. Canon Cheetham, J. C. Conybeare, Esq., W. Courthope, Esq., Sir Frederick Elliot, Rev. E. E. Estcourt, H. W. Freeland, Esq., Sydney Gedge, Esq., Prof. Gladstone, F. Harrison, Esq., Dr. J. J. Jusserand, C. M. Kennedy, Esq., Rev. Stanley Leathes, D.D., W. Watkiss Lloyd, Esq., H. Maxwell Lyte, Esq., James Cotter Morison, Esq., Earl of Morley, Rev. Mark Pattison, Dr. Munk, F. Pollock, Esq., Rev. Dr. Reynolds, Herbert Spencer, Esq., Leslie Stephen, Esq.

The Library contains 90,000 Volumes of Ancient and Modern Literature, in various languages. Subscription, £3 a year, or £2 with Entrance Fee of £6, Life Membership, £26. Fifteen Volumes are allowed to Country and Ten to Town Members. Reading Rooms open from Ten to Half-past Six. Catalogue, *new edition*, 1875 (1,062 pp), price 16s.; to Members, 12s. Prospectuses on application.

ROBERT HARRISON, Secretary and Librarian.

A COURSE of SIX ELEMENTARY LECTURES on GEOLOLGY and PALÆONTOLOGY will be given by J. TENNANT, F.G.S., Professor of Geological Mineralogy at King's College, London, Mineralogist to Her Majesty and to the Baroness Burdett-Coutts, on July 5, 6, 7, 8, 9, and 10, at 10 a.m., at his residence, 149, Strand. A Course of Six Elementary Lectures on MINERALOGY, so adapted as to facilitate the Study of Geology and of the Mineral Substances used in the Arts, on July 12, 13, 14, 15, 16, and 17. To be followed by Six Elementary Lectures on ROCKS and METALLIC MINERALS, on July 19, 20, 21, 22, 23, and 24. Terms, 10s 6d. for each Course, or One Guinea for the Three Courses Private Instruction on the above subjects is also given at 149, Strand, W.C., by Prof. TENNANT. Terms, 7s for one lesson of one hour

MINERALOGY AND GEOLOGY.

COLLECTIONS OF 200 SPECIMENS IN CABINETS,

Specially adapted for Students and Teachers, price 42s.

Smaller Collections at same rate. These Collections are used with success by nearly all geological science teachers in the United Kingdom. Single Specimens and every requisite of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

See new Lists of Collections, new List of Apparatus, &c. Established 22 years in London.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address:—CASTLETON, *viâ* SHEFFIELD.

MUSEUMS AND COLLECTORS.

MR. DAMON, of WEYMOUTH, will forward an abridged Catalogue of his Collections in Natural History Objects, including RECENT SHELLS (Foreign and British), FOSSIL REMAINS, MINERALS, ROCKS, MARINE ZOOLOGY, &c., &c., &c.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, MICROSCOPIST'S and NATURALIST'S STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B has last week sent to his subscribers specimens of the Entomostracon, *Hyalodaphnia Kahlbergensis* (new to Great Britain last year), with drawing and description. He has also sent out *Leptodora hyalina, Anuræa longispina, Ceratium longicornis, Brachionus pala*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Hints on the Preservation and Examination of Living Objects, 3d.

THOMAS D. RUSSELL'S

NATURAL HISTORY STORES,

48, ESSEX STREET, STRAND, W.C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro- Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Catalogues Post Free.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS OF

CALEDONITE, LEADHILLITE, AND FIBROUS MALACHITE,

FROM LEADHILLS.

COLLECTIONS FOR STUDENTS, from £2 2s.
COLLECTIONS FOR BEGINNERS, from 4s.
BLOWPIPE CASES AND APPARATUS

MACMILLAN & CO., LONDON.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE BEST FARMERS' NEWSPAPER.

THE CHAMBER OF AGRICULTURE JOURNAL

AND FARMERS' CHRONICLE,

Edited by JOHN ALGERNON CLARKE, Secretary to the Central Chamber of Agriculture,

Devotes special attention to the discussions and proceedings of the Chamber of Agriculture of Great Britain (which now number upwards of 18,000 members), besides giving original papers on practical farming, and a mass of intelligence of particular value to the agriculturist.

The London Corn, Seed, Hop, Cattle, and other Markets of Monday are specially reported in this Journal, which is despatched the same evening so as to ensure delivery to country subscribers by the first post on Tuesday morning. Price 3*d*., or prepaid, 13*s*. a year post free.

Published by W. PICKERING, 21, Arundel Street, Strand, W.C.

DIAMONDS AND OTHER PRECIOUS

STONES Scientific opinion given as to GENUINENESS, PURITY, and VALUE.—BRYCE WRIGHT, 90, Great Russell Street, London.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R MCLACHLAN, F.R.S., E. C. RYE, F.Z.S., and H. T. STAINTON, F.R S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s*. each; the succeeding vols. may be had separately or together, at 7*s*. each.

ENGINEERING GEOLOGY.

"A full and lucid description of surveying and mapping, the diagnosing of the various minerals met with, the value of sites and rocks for engineering operations, &c"—*Popular Science Review.*

Price 21*s*., with numerous Photographs and Coloured Plates.

OUR TRIP TO BURMAH.

By C. A. GORDON, Commander of the Bath.

"A wonderful book, full of interest, instruction, and amusement."—*Saturday Review.*

Thirteenth Thousand, cloth, 1*s*.

THE STARS AND THE EARTH;

OR, THOUGHTS UPON SPACE, TIME, AND ETERNITY.

Revised and Enlarged, with Notes, by R A PROCTOR, B.A, Hon. Sec. Royal Astronomical Society.

Small Volume for the Pocket, Paper Wrapper, 2*s*., cloth, 2*s*. 6*d*.

AIDS TO PHYSIOLOGY.

By B. THOMPSON LOWNE, F.R.C.S, Arris and Gale Lecturer on Physiology, Examiner in Physiology, Royal College of Surgeons.

Same Series, 2nd Thousand.

AIDS TO CHEMISTRY.

By C. E. ARMAND SEMPLE, B.A., M.B., Cantab., Examiner in Arts at the Apothecaries' Hall.

"INORGANIC," 2*s*.; cloth, 2*s* 6*d*. "ORGANIC," 2*s*., 2*s* 6*d*.

Crown 8vo, price 3*s*. 6*d*.

MANUAL FOR THE PHYSIOLOGICAL LABORATORY.

By V HARRIS, M.D., M.R.C.P.Lond., and D'ARCY POWER, B.A.Oxon.

Third Edition, price 2*s*. 6*d*.

OVERWORK AND PREMATURE MENTAL DECAY.

By C. H. F. ROUTH, M.D., M.R.C.P., Lond.

With 116 Engravings, price 7*s*. 6*d*.

THE HAIR: ITS GROWTH, CARE, DISEASES, AND TREATMENT;

with Historical Chapters on Fashions in Hair and Beards from the Assyrian to Modern Times.

By C. H. LEONARD, M.A., M.D.

London: BAILLIÈRE, TINDALL, & COX, Medical and Scientific Publishers, 20, King William Street, Strand.

Now ready, post quarto, cloth gilt, 272 pages. Price 16*s*.

LIGHTNING CONDUCTORS:

THEIR

HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S, F G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings, which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York. 446, Broome Street. 1880.

Now ready, post 8vo, with Portrait and Map, cloth, 14*s*.

THE BIRDS OF CORNWALL AND THE SCILLY ISLANDS.

By the late EDWARD HEARLE RODD.

Edited, with an Introduction, Appendix, and brief Memoir of the Author, by JAMES EDMUND HARTING, F.L.S., F.Z.S.

London: TRÜBNER & CO, Ludgate Hill.

BRYCE-WRIGHT'S LATEST ARRIVALS.

GEMS.—A few very fine Precious Cat's-Eyes; Alexandrites from Burmah.

SHELLS.—A magnificent specimen of the *Conus gloria-maris*, the rarest known shell.

MINERALS.—Magnificent Opals from Queensland, Anglesites from Monte Poni, Sardinia; Dioptase from Siberia, &c.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

⁂ Upwards of 100,000 Vols. of this series have been sold.

COWPER. By GOLDWIN SMITH. Crown 8vo. 2s. 6d. [*Just ready.*

CHAUCER. By Prof. A. W. WARD. Crown 8vo. 2s. 6d.

BUNYAN. By J. A. FROUDE. Crown 8vo. 2s. 6d.
"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN. Crown 8vo. 2s 6d.
"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES. Crown 8vo. 2s. 6d.
"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON. Crown 8vo. 2s 6d.
"Mr Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN. Crown 8vo. 2s. 6d.
"The new series opens well with Mr Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON. Crown 8vo. 2s. 6d.
"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON. Crown 8vo. 2s. 6d.
"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS. Crown 8vo. 2s 6d.
"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S. Crown 8vo. 2s. 6d.
"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK. Crown 8vo. 2s. 6d.
"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. MINTO. Crown 8vo. 2s. 6d.
"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal SHAIRP. Crown 8vo. 2s. 6d.
"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry. . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S. Crown 8vo. 2s. 6d.
"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE. Crown 8vo. 2s. 6d
"Mr. Trollope' sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY. Crown 8vo. 2s. 6d.
"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

Others in Preparation.

LEICESTER MUSEUM.—CURATOR.

Wanted, a CURATOR to take the Practical Management of the Leicester Museum The Candidates not to be more than about 35 years of age, and to have had some experience in a London, Provincial, or Private Museum. Honorary Curators will advise in each Department

Salary, £150 per annum, and the person appointed will be required to devote the whole of his time to the duties of his office

Applications and Testimonials to be sent, on or before the 20th July next, addressed to the Town Clerk, Leicester, endorsed "Application for Curatorship."

By order, JNO. STOREY, Town Clerk.
Town Hall, Leicester, 30th June, 1880.

INSTITUTE OF CHEMISTRY OF GREAT BRITAIN AND IRELAND.

An EXAMINATION in PRACTICAL CHEMISTRY in connection with the Institute will be held on MONDAY, 26th July, and four following days. Examiner—Dr. W. R. HODGKINSON. Candidates are requested to communicate with the Secretary, Mr. Charles E. Groves, Somerset House Terrace, London, W.C.

EXETER SCHOOL.

The CHEMISTRY MASTERSHIP will be VACANT in August.
For further information apply after July 18 to the Head Master.

EXETER SCHOOL.

Two SCHOLARSHIPS of £60 a year for two years to be competed for on September 16.

They may be awarded for Classics, Mathematics, Science, English or Modern Languages.

Apply to the Head Master.

ZOOLOGICAL SOCIETY'S GARDENS,

REGENT'S PARK.—The next DAVIS LECTURE will be given by P L. SCLATER, Esq, M A., Ph D, F.R S., in the Lecture Room in the Society's Gardens, Regent's Park, on THURSDAY, July 8, at 5 o'clock p.m. Subject: "Waterfowl."

SILVERED GLASS SPECULA.

JOHN BROWNING begs respectfully to inform the scientific public that he can supply Specula from 3½ in. to 18 in. diameter, of Mr. With's parabolising. The stock is composed of the choicest reserves of the last ten years of Mr. With's productions, and Mr. With's Specula are generally admitted to be the finest ever made.

Each Mirror bears Mr. With's signature.

A reduced Price List of Specula, Mounted or Unmounted, will be forwarded post free.

JOHN BROWNING,

Optical and Physical Instrument Maker to H.M. Government, the Royal Society, the Royal Observatories of Greenwich and Edinburgh, and the Observatories of Kew, Cambridge, Durham, Utrecht, Melbourne, &c., &c.

63, STRAND, W.C., LONDON.

FACTORY—Southampton Street, London, W.C.

BURLINGTON HOUSE,

RICHMOND HILL, SURREY

Mr. A N. FYNES-CLINTON, M.A., late Junior Student of Christ Church, Oxford, Graduate in Classical Honours, and Mr. R. HAWKINS, M.A., late Scholar of Corpus Christi College, Cambridge, Graduate in the Mathematical Tripos, receive Sons of Gentlemen from 8 to 15 years of age to prepare for the Public Schools, &c.

There is a separate class-room for each class, and the bed-rooms are large and lofty. The Household arrangements are under the care of Mrs. HAWKINS.

Successes this year include a First Entrance Exhibition at Westminster.

Prospectuses and Testimonials will be forwarded on application.

GERMAN SCIENCE TEACHER.—A Son of Dr. Hermann Müller, of the Lippstadt Realschule, and well known to the readers of Nature, desires to obtain a post in a good English school or college. Herr Muller, Jun, has acquired from a Prussian Board of Examination the qualification to teach Mathematics, Physics, Chemistry, and Natural History, and has been for three years a teacher in the same school as his father. Herr Muller is desirous of becoming more thoroughly acquainted with the English language and English educational institutions, and therefore would be satisfied with a moderate salary Apply to Dr. Hermann Muller, Oberlehrer, Lippstadt, Germany.

READING PARTY.—A GRADUATE in Science (London University), accompanied by another Gentleman, will take a Reading Party, during the Summer Vacation, to the Isle of Anglesea, and give Practical Instruction in the Geology, Botany, Zoology, Physical Geography, &c., of the District.—Apply F. C. S., Billington's, Rugby.

MACMILLAN & CO., LONDON.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

Now publishing, in Crown 8vo Price 2s 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

⁂ Upwards of 100,000 Vols. of this series have been sold.

POPE. By LESLIE STEPHEN. Crown 8vo. *2s. 6d.*

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken Readers who have made Pope a study and found his poetry a delight are not likely to accept all the terse and incisive criticisms scattered through these pages. Every reader, however, will acknowledge that an extremely difficult task has been well accomplished."—*St James's Gazette.*

COWPER. By GOLDWIN SMITH. Crown 8vo. *2s. 6d.*

CHAUCER. By Prof. A. W. WARD. Crown 8vo. *2s. 6d.*

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE. Crown 8vo. *2s. 6d.*

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN. Crown 8vo. *2s 6d,*

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES. Crown 8vo. *2s 6d.*

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made"—*New York Nation.*

MILTON. By MARK PATTISON. Crown 8vo. *2s 6d.*

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN. Crown 8vo. *2s. 6d.*

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON. Crown 8vo. *2s. 6d.*

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON. Crown 8vo. *2s. 6d.*

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS. Crown 8vo. *2s. 6d.*

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S. Crown 8vo. *2s. 6d.*

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK. Crown 8vo. *2s. 6d.*

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. MINTO. Crown 8vo. *2s. 6d.*

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal SHAIRP. Crown 8vo. *2s. 6d.*

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry. . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S. Crown 8vo. *2s 6d.*

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE. Crown 8vo. *2s 6d*

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY. Crown 8vo. *2s. 6d.*

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

Others in Preparation.

MACMILLAN AND CO., LONDON.

Now ready, post quarto, cloth gilt, 272 pages. Price 16s.

LIGHTNING CONDUCTORS:

THEIR
HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street 1880.

NEW WORKS PUBLISHED BY
BAILLIÈRE, TINDALL, & COX, LONDON.

HOLLOWAYS PILLS

THIS MEDICINE

Is a Certain Cure for all Disorders of the LIVER, STOMACH AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints.

In Crown 8vo, price 2s. 6d.

THE YEAR'S ART:

A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE which have occurred during the year 1879, together with information respecting the events of the year 1880.

Compiled by MARCUS B. HUISH, LL.B.

"This little volume of statistics and information will be of service to many readers, and the compiler has done his work well."—*Pall Mall Gazette.*

"It contains a great deal of useful information arranged in a way which makes reference easy."—*Athenæum.*

"This new handbook supplies what has hitherto been a void in year-books, and deserves, nor can we doubt that it will obtain, a large share of popular support. . . . As far as we have been able to test Mr. Huish's volume, it admirably fulfils its purpose."—*John Bull.*

"Let us conclude this notice by heartily thanking Mr. Huish for his excellent handbook. It is sold at half-a-crown; we would willingly have given a guinea for it, and only regret it was not thought of sooner."—*Portfolio.*

MACMILLAN & CO., LONDON.

ELEMENTARY CLASS-BOOKS OF SCIENCE.

ASTRONOMY, by the Astronomer-Royal.

POPULAR ASTRONOMY. With Illustrations. By Sir G. B. Airy, K.C.B., Astronomer-Royal. New Edition. 18mo. 4*s.* 6*d.*

Six lectures, intended "to explain to intelligent persons the principles on which the instruments of an Observatory are constructed, and the principles on which the observations made with these instruments are treated for deduction of the distances and weights of the bodies of the Solar System."

ASTRONOMY.

ELEMENTARY LESSONS IN ASTRONOMY. With Coloured Diagram of the Spectra of the Sun, Stars, and Nebulæ, and numerous Illustrations. By J. Norman Lockyer, F.R.S. New Edition. 18mo. 5*s.* 6*d.*

"Full, clear, sound, and worthy of attention, not only as a popular exposition, but as a scientific 'Index.'"—*Athenæum.*

QUESTIONS ON LOCKYER'S ELEMENTARY LESSONS IN ASTRONOMY. For the Use of Schools. By John Forbes-Robertson. 18mo, cloth limp. 1*s.* 6*d.*

PHYSIOLOGY.

LESSONS IN ELEMENTARY PHYSIOLOGY. With numerous Illustrations. By T. H. Huxley, F.R.S., Professor of Natural History in the Royal School of Mines. New Edition. 18mo. 4*s.* 6*d.*

"Pure gold throughout."—*Guardian.*

"Unquestionably the clearest and most complete elementary treatise on this subject that we possess in any language."—*Westminster Review.*

QUESTIONS ON HUXLEY'S PHYSIOLOGY FOR SCHOOLS. By T. Alcock, M.D. 18mo. 1*s.* 6*d.*

BOTANY.

LESSONS IN ELEMENTARY BOTANY. By D. Oliver, F.R.S., F.L.S., Professor of Botany in University College, London. With nearly Two Hundred Illustrations. New Edition. 18mo. 4*s.* 6*d.*

CHEMISTRY.

LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC AND ORGANIC. By Henry E. Roscoe, F.R.S., Professor of Chemistry in Owens College, Manchester. With numerous Illustrations and Chromo-Litho of the Solar Spectrum, and of the Alkalies and Alkaline Earths. New Edition. 18mo. 4*s.* 6*d.*

"As a standard general text-book it deserves to take a leading place."—*Spectator.*

"We unhesitatingly pronounce it the best of all our elementary treatises on Chemistry."—*Medical Times.*

A SERIES OF CHEMICAL PROBLEMS, prepared with Special Reference to the above, by T. E. Thorpe, Ph.D., Professor of Chemistry in the Yorkshire College of Science, Leeds. Adapted for the preparation of Students for the Government, Science, and Society of Arts Examinations. With a Preface by Professor Roscoe. New Edition, with Key, 18mo. 2*s.*

POLITICAL ECONOMY.

POLITICAL ECONOMY FOR BEGINNERS. By Millicent G. Fawcett. New Edition. 18mo. 2*s.* 6*d.*

"Clear, compact, and comprehensive."—*Daily News.*

"The relations of capital and labour have never been more simply or more clearly expounded."—*Contemporary Review.*

LOGIC.

ELEMENTARY LESSONS IN LOGIC; Deductive and Inductive, with copious Questions and Examples, and a Vocabulary of Logical Terms. By W. Stanley Jevons, M.A. Professor of Logic in University College, London. New Edition. 18mo. 3*s.* 6*d.*

"Nothing can be better for a school-book."—*Guardian.*

"A manual alike simple, interesting, and scientific."—*Athenæum.*

PHYSICS.

LESSONS IN ELEMENTARY PHYSICS. By Balfour Stewart, F.R.S., Professor of Natural Philosophy in Owens College, Manchester. With numerous Illustrations and Chromo-litho of the Spectra of the Sun, Stars, and Nebulæ. New Edition. 18mo. 4*s.* 6*d.*

"The beau-ideal of a scientific text-book, clear, accurate, and thorough."—*Educational Times.*

PRACTICAL CHEMISTRY.

THE OWENS COLLEGE JUNIOR COURSE OF PRACTICAL CHEMISTRY. By Francis Jones, Chemical Master in the Grammar School, Manchester. With Preface by Professor Roscoe, and Illustrations. New Edition. 18mo. 2*s.* 6*d.*

ANATOMY.

LESSONS IN ELEMENTARY ANATOMY. By St. George Mivart, F.R.S., Lecturer in Comparative Anatomy at St. Mary's Hospital. With upwards of 400 Illustrations. 18mo. 6*s.* 6*d.*

"It may be questioned whether any other work on anatomy contains in like compass so proportionately great a mass of information."—*Lancet.*

"The work is excellent, and should be in the hands of every student of human anatomy."—*Medical Times.*

STEAM.

AN ELEMENTARY TREATISE. By John Perry, Bachelor of Engineering, Whitworth Scholar, &c., late Lecturer in Physics at Clifton College. With numerous Woodcuts and Numerical Examples and Exercises. 18mo. 4*s.* 6*d.*

"The young engineer and those seeking for a comprehensive knowledge of the use, power, and economy of steam, could not have a more useful work, as it is very intelligible, well arranged, and practical throughout."—*Ironmonger.*

PHYSICAL GEOGRAPHY.

ELEMENTARY LESSONS IN PHYSICAL GEOGRAPHY. By A. Geikie, F.R.S., Murchison Professor of Geology, &c., Edinburgh. With numerous Illustrations. 18mo. 4*s.* 6*d.*

QUESTIONS ON THE SAME. 1*s.* 6*d.*

NATURAL PHILOSOPHY.

NATURAL PHILOSOPHY FOR BEGINNERS. By I. Todhunter, M.A., F.R.S. Part I. The Properties of Solid and Fluid Bodies. 18mo. 3*s.* 6*d.*

Part II. Sound, Light, and Heat. 18mo. 3*s.* 6*d.*

GEOGRAPHY.

CLASS-BOOK OF GEOGRAPHY. By C. B. Clarke, M.A., F.G.S. New Edition, with eighteen coloured Maps. Fcap. 8vo. 3*s.*

"Contains a large amount of information, systematically arranged."—*Examiner.*

BRITISH ASSOCIATION
FOR THE
ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25

PRESIDENT-ELECT.

ANDREW CROMBIE RAMSAY, Esq., LL.D., F.R.S., V.P.G.S., Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting* It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section……………………" Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the ASSISTANT-SECRETARY, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

GLASGOW
MECHANICS' INSTITUTION,

AIDED AS A TECHNICAL SCHOOL BY
THE ROYAL INCORPORATION OF HUTCHESONS' HOSPITAL.

APPOINTMENT OF LECTURER ON MATHEMATICS, &c., AND OF INSTRUCTOR OF DRAWING.

The Council of this Institution invite Applications for the Appointment of a LECTURER and TEACHER for the Day and Evening Classes on Technical Arithmetic, Mathematics, Nautical Astronomy, and Navigation. The emoluments are expected to amount to about £320 per annum.

Applications are also invited for the Appointment of INSTRUCTOR of DRAWING (including Freehand Drawing, Building and Machine Construction). The emoluments are expected to amount to about £220 per annum.

The gentlemen appointed will require to devote their whole time to the duties Further particulars may be had from the Hon. Secretary.

Applications, endorsed on cover, are to be addressed to the undersigned, 38, Bath Street, Glasgow, and delivered not later than 30th inst.

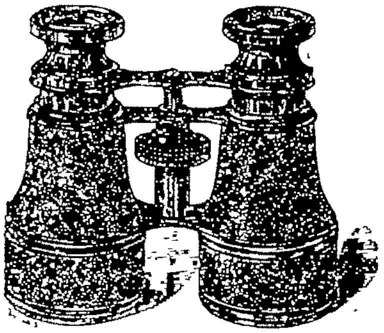
CHARLES C LINDSAY, Hon. Sec.

13th July, 1880.

GOVERNMENT FUND OF £4,000
FOR THE PROMOTION OF SCIENTIFIC RESEARCH.

A MEETING of the Government-Fund Committee will be held in FEBRUARY, 1881. It is requested that applications to be considered at that Meeting be forwarded to the Secretaries of the Royal Society, Burlington House, before the 31st of December, 1880.

BROWNING'S BINOCULARS.



THE "ECONOMICAL" FIELD GLASS.

This Binocular has achromatic object-glasses 1⅓ inch in diameter, and sliding shades to shelter the object-glasses from sun or rain, and is fitted in a solid leather sling case, price £1 5*s.*; sent free for £1 6*s.* 6*d.*.

Illustrated Catalogue of Binoculars post free.

JOHN BROWNING, 63, Strand, London, W.C.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. ORD, M.D, Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examination of the University of London Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office

Prospectus and all particulars can be obtained from the Secretary, Dr GILLESPIE.

W. M. ORD, M.D., Dean.

GOVERNMENT GRANT OF £1,000.

A MEETING of the Government-Grant Committee will be held in FEBRUARY, 1881. It is requested that applications to be considered at that Meeting be forwarded to the Secretaries of the Royal Society, Burlington House, before the 31st December, 1880.

ZOOLOGICAL SOCIETY'S GARDENS,

REGENT'S PARK.—The last of the Series of the DAVIS LECTURES will be given in the Lecture Room in the Society's Gardens, Regent's Park, on THURSDAY, July 15, at 5 o'clock p.m. Subject: "Birds."

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

BRITISH ASSOCIATION
FOR THE
ADVANCEMENT OF SCIENCE.

MEETING IN SWANSEA, 1880.

Inventors and others wishing to exhibit at the *Conversazione* to be held on August 26, should at once communicate with the Local Secretaries, British Association, Swansea.

BOROUGH OF LEICESTER.

LEICESTER MUSEUM.—CURATOR.

Wanted, a CURATOR to take the Practical Management of the Leicester Museum The Candidates not to be more than about 35 years of age, and to have had some experience in a London, Provincial, or Private Museum. Honorary Curators will advise in each Department.

Salary, £150 per annum, and the person appointed will be required to devote the whole of his time to the duties of his office.

Applications and Testimonials to be sent, on or before the 20th July next, addressed to the Town Clerk, Leicester, endorsed "Application for Curatorship"

By order, JNO. STOREY, Town Clerk.

Town Hall, Leicester, 30th June, 1880

GERMAN SCIENCE TEACHER.—A Son of Dr Hermann Muller, of the Lippstadt Realschule, and well known to the readers of NATURE, desires to obtain a post in a good English school or college Herr Muller, Jun, has acquired from a Prussian Board of Examination the qualification to teach Mathematics, Physics, Chemistry, and Natural History, and has been for three years a teacher in the same school as his father. Herr Müller is desirous of becoming more thoroughly acquainted with the English language and English educational institutions, and therefore would be satisfied with a moderate salary. Apply to Dr. HERMANN MULLER, Oberlehrer, Lippstadt, Germany.

EXETER SCHOOL.

The CHEMISTRY MASTERSHIP will be VACANT in August. For further information apply after July 18 to the HEAD MASTER.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany. Physiology, Chemistry. All the work practical.

TO CONCHOLOGISTS, MINERALOGISTS, and GEOLOGISTS.—SEVERAL GOOD SECOND-HAND CABINETS for SALE, suitable for Shells, Minerals, or Fossils. Lists with Descriptions, Dimensions, and Prices upon application to G B SOWERBY, 45, Great Russell Street, London, W.C.

BOTANICAL ABSTRACTS.—Wanted, a Botanist to abstract French and German Botanical Papers —Address (by letter) C. B B. R., No. 14, Henrietta Street, Covent Garden, W.C.

A few Fine Specimens of Japanese China and Enamel.

MINERALOGY AND GEOLOGY.

COLLECTIONS OF 200 SPECIMENS IN CABINETS,
Specially adapted for Students and Teachers, price 42s.

Smaller Collections at same rate. These Collections are used with success by nearly all geological science teachers in the United Kingdom. Single Specimens and every requisite of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

See new Lists of Collections, new List of Apparatus, &c. Established 22 years in London.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

12, FRITH STREET, SOHO, W.

DIAMONDS AND OTHER PRECIOUS STONES. Scientific opinion given as to GENUINENESS, PURITY, and VALUE.—BRYCE WRIGHT, 90, Great Russell Street, London.

THE NEW BIOLOGICAL JOURNAL.

ARCHIVES DE BIOLOGIE.

Edited by Professors EDOUARD VAN BENEDEN of Liège, and VAN BAMBEKE of Ghent.

This Journal is devoted to the publication of original Memoirs on the Embryology, Histology, Physiology, and Comparative Anatomy of Plants and Animals. Each number is illustrated with numerous Coloured Plates, and appears at the commencement of the Quarter.

Price:—A Single Number, Six Shillings and Sixpence. Annual Subscription Twenty-five Shillings, or Twenty-seven Shillings post free

Orders received by Messrs. WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London.

In the first two numbers have appeared:—

VAN BENEDEN On the Embryology of the Mammalia.
VAN BAMBEKE. On the Cleavage of the Egg in Batrachia.
FOR HINGER: On the Termination of Nerves in the Muscles of Insects.
FREDERIQUE AND VANDEVELDE: On the Physiology of the Muscles and Nerves of the Lobster.
MACLEOD: On the Harderian Gland of the Duck, &c., &c

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by J. W. DOUGLAS, R McLACHLAN, F.R.S., E. C. RYE, F.Z.S., and H. T STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

Now ready, Vol. XIV., Part IV., price 6*s*.

THE JOURNAL OF ANATOMY AND PHYSIOLOGY NORMAL AND PATHOLOGICAL.

CONDUCTED BY

Profs. HUMPHRY, TURNER, M'KENDRICK, & Dr. CREIGHTON.

This Volume contains 30 Plates and numerous Woodcuts

Contents.

1. Rete Mirabile of Narwhal. By H S. Wilson, M.D (Plates XXI XXIII)
2. Coronary Veins of Stomach. By W J Walsham, F.R.C.S. (Plate XXIV.)
3. Coronary Veins of Stomach. By Prof. Turner.
4. Communication between Air-Bladder and Cloaca in Herring. By F. W. Bennett.
5. Curvatores Coccygis Muscles of Man By Prof M. Watson.
6. Valvular Hæmatoma By G. A. Gibson, M.B. (Plate XXV)
7. Pathology of *Macroglossia* and *Hygroma* By R. Maguire (Plate XXVI)
8. Changes in Spinal Cord after Amputation of Limbs. By. J. Dreschfeld, M.D. (Plate XXVI)
9. Morbid Anatomy of Post-Scarlatinal Nephritis By B. C Waller, M.D. (Plate XXVII)
10. Antagonism of Opium and Belladonna By J G. Naismyth, M B.
11. Presence of Astragalo-Scaphoid Bone in Man. By R. J Anderson, M.D
12. Mode of Healing in Wounds under Antiseptic Dressings By D. Foulis, M.D.
13. Respiratory Movements of Fishes. By Prof. M'Kendrick. (Plate XXVIII.)
14. Anatomy of the Porpoise By G B. Howes. (Plate XXIX.)
15. Two Masks and Skull from Islands near New Guinea By Prof. Turner (Plate XXX)
16. Effect of Anæsthetics on Pulmonary Circulation. By D. Newman, M.B.
17. Method of Preserving Colours of Tissues By H. Bendall.
18. Variations in Myology By J. Macdonald Brown
19. Anatomical Notices. By G A Gibson

MACMILLAN & CO , London and Cambridge.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F L.S , F.Z.S., Member of the British Ornithologists' Union ; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

THE BREWERS' GUARDIAN:

A Fortnightly Paper devoted to the Protection of Brewers' Interests, Licensing, Legal, and Parliamentary Matters.

REVIEW OF THE MALT AND HOP TRADES; AND WINE AND SPIRIT TRADE RECORD.

The Organ of the Country Brewers.

"The Brewers' Guardian" is published on the evenings of every alternate Tuesday, and is the only journal officially connected with brewing interests, Subscription, 16*s*. 6*d*. per annum, post free, dating from any quarter-day. Single Copies 1*s*. each. Registered for transmission abroad.

Offices—5, Bond Court Walbrook, London, E.C.

No. LXXIX., July, Price 7*s* 6*d*.

THE QUARTERLY JOURNAL OF MICROSCOPICAL SCIENCE.

Edited by
E RAY LANKESTER, M A., F.R.S., F.L.S ,
Fellow of Exeter College, Oxford, and Professor of Zoology and Comparative Anatomy in University College, London ,
With the co-operation of
WM. ARCHER, F.R.S., M.R.I.A ,
Dublin ,
F. M BALFOUR, M.A , F R.S , F.L S ,
Fellow and Lecturer of Trinity College, Cambridge, and
E. KLEIN, M.D , F.R.S ,
Lecturer on Histology in St. Bartholomew's Hospital Medical School, London.

CONTENTS.

MEMOIRS:—
- On the Structure and Homologies of the Germinal Layers of the Embryo. By F M Balfour, M.A , F R S.
- Hubrecht's Researches on the Nervous System of Nemertines. With Plate.
- On the Structure of the Nephridia of the Medicinal Leech. By A. G. Bourne With Two Plates.
- On Intra-Epithelial Capillaries in the Integument of the Medicinal Leech. By E. Ray Lankester, M.A., F R.S With Plate
- On the Connective and Vasifactive Tissues of the Medicinal Leech. By E. Ray Lankester, M.A., F R.S. With Two Plates.
- On the Use of the Wenham Binocular with High Powers. By Heneage Gibbes, M B.
- On the Structure of the Human Spermatozoon By Heneage Gibbes, M B.
- Some Disputed Points in Echinoderm Morphology. By P. Herbert Carpenter, M A
- The Origin of the Red Blood-Corpuscles. By Professor Pouchet.

On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic*.

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen*.

Now publishing, in Crown 8vo. Price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 100,000 Vols. of this series have been sold.

POPE. By Leslie Stephen. Crown 8vo. 2s. 6d.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken. Readers who have made Pope a study and found his poetry a delight are not likely to accept all the terse and incisive criticisms scattered through these pages. Every reader, however, will acknowledge that an extremely difficult task has been well accomplished."—*St. James's Gazette.*

COWPER. By Goldwin Smith. Crown 8vo. 2s. 6d.

CHAUCER. By Prof. A. W. Ward. Crown 8vo. 2s. 6d.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. Froude. Crown 8vo. 2s. 6d.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. Dowden. Crown 8vo. 2s. 6d.

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By Henry James. Crown 8vo. 2s. 6d.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By Mark Pattison. Crown 8vo. 2s. 6d.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By Leslie Stephen. Crown 8vo. 2s. 6d.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. Hutton. Crown 8vo. 2s. 6d.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. Morison. Crown 8vo. 2s. 6d.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. Symonds. Crown 8vo. 2s. 6d.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. Huxley, F.R.S. Crown 8vo. 2s. 6d.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By William Black. Crown 8vo. 2s. 6d.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. Minto. Crown 8vo. 2s. 6d.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal Shairp. Crown 8vo. 2s. 6d.

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the Dean of St. Paul's. Crown 8vo. 2s. 6d.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By Anthony Trollope. Crown 8vo. 2s. 6d.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By John Morley. Crown 8vo. 2s. 6d.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

Others in Preparation.

MACMILLAN AND CO., LONDON.

A PHYSICAL TREATISE
ON
ELECTRICITY & MAGNETISM.

BY J. E. H. GORDON, B.A.,
Cambridge, Assistant-Secretary of the British Association.
2 vols., demy 8vo, cloth extra, 36*s.*

"Perhaps the best text-book ever done."—*Vanity Fair.*

"Too much praise cannot well be given to the description, illustration, and modes of using modern instruments."—*Electrician* (Preliminary Notice).

"We must congratulate Mr. Gordon and the scientific world generally upon a work which in this department sheds so great credit on British science."—*Engineering.*

"Thoroughly good . . . . this unequalled text-book."—*The Teacher.*

"The most complete account of electric science with which we are acquainted."—*Sheffield Daily Telegraph.*

London: SAMPSON LOW, MARSTON, SEARLE, & RIVINGTON, Crown Buildings, 188, Fleet Street, E.C.

LA BELLE SAUVAGE YARD, LUDGATE HILL, LONDON.

CASSELL, PETTER, GALPIN, & CO.'S ANNOUNCEMENTS.

Now ready, the Second Series (complete in One Volume, price 12*s.* 6*d.*) of

FAMILIAR WILD FLOWERS. By F. E. Hulme, F.L.S., F.S.A., Art Master in Marlborough College. With Forty Full-Page Coloured Plates, and Descriptive Text.

"The coloured figures are exquisitely beautiful; they are more like finished paintings than prints, and the appearance of the work is elegant throughout."—*Gardener's Magazine.*

"The beauty and fidelity of the illustrations to this work, the pleasant mode of instruction on a delightful subject, and the handsome binding, combine to make of it a charming gift-book."—*Court Circular.*

Now ready, complete in One Volume, demy 4to, price 35*s.*; half morocco, 45*s.*

CANARIES and CAGE BIRDS, The ILLUSTRATED BOOK OF BRITISH AND FOREIGN. By W. A. BLAKSTON, A. WIENER, and W. SWAYSLAND. With Fifty-Six Beautiful Fac-simile Coloured Plates, and numerous Wood Engravings.

"We do not know a book in which so many varieties of the canary family are so brilliantly depicted, and in which they are so fully described and dealt with from every point of view. Its attractive aspect, its splendid illustrations, and its numerous merits as a guide to bird-fanciers, ought to make it very popular."—*Queen.*

Now ready, Two Volumes (each complete in itself) of

SCIENCE for ALL. Edited by Dr. Robert Brown, M.A., F.L.S., &c., assisted by Eminent Scientific Writers. Each containing about 350 Illustrations and Diagrams. Extra crown 4to, cloth, 9*s.* each.

"All branches of science equally find a place in the work. . . . . The illustrations are very good, and the work entirely maintains its original high standard."—*Academy.*

In the Press, and to be shortly Published in Monthly Parts, price 1*s.*

PAXTON'S FLOWER GARDEN,

By PROF. LINDLEY and SIR JOSEPH PAXTON.

Thoroughly revised and brought down to the present date by Mr. THOMAS BAINES, F.R.H.S., with many entirely NEW COLOURED PLATES executed expressly for this Edition.

This New Edition of PAXTON'S FLOWER GARDEN will contain large Fac-simile Coloured Plates of the new and remarkable plants recently introduced into cultivation. Many new Plates will be specially executed for this Edition, and the descriptive text will be entirely revised in accordance with the latest researches, both in regard to the extended notices of new plants, and also with respect to original notes and memoranda. The Work as now issued cannot fail to be of importance and value not only to professional and amateur gardeners, but to the large number of persons interested in Floriculture.

*** Prospectuses are in preparation, and may be had at all Booksellers', or will be sent post free on application to CASSELL, PETTER, GALPIN, & CO., Ludgate Hill, London.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, July 15, 1880.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

SOUND: ELEMENTARY LESSONS ON.
By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

Now ready, complete in three vols., 8vo.

INORGANIC CHEMISTRY. By Prof. ROSCOE, F.R.S., and Prof. SCHORLEMMER, F.R.S., of Owens College, Manchester. With Illustrations, &c.

Vol. I. The NON-METALLIC ELEMENTS. 21s.
Vol. II. Part 1.—METALS. 18s.
Vol. II. Part 2.—METALS. 18s. [*This day.*

"It would be difficult to praise this most valuable Manual too highly. . . . . . The arrangement is clear and scientific; the facts gained by modern research are fairly represented and judiciously selected, and the style throughout is singularly lucid." —*Lancet.*

"A most valuable contribution to the literature of chemistry. . . . . . The work when finished will afford the most complete systematic exposition of the existing state of chemical science that has yet appeared in the English language."—*Nature.*

By Prof. ROSCOE, F.R.S.

LESSONS IN ELEMENTARY CHEMISTRY; Inorganic and Organic. With numerous Illustrations. New Edition. Fcap. 8vo. 4*s*. 6*d*.

PRIMER OF CHEMISTRY. With Illustrations. 18mo. 1*s*.

By Prof. SCHORLEMMER, F.R.S.

THE CHEMISTRY OF THE CARBON COMPOUNDS; or, Organic Chemistry. With Illustrations. 8vo. 14*s*.

"A better book than this, on organic chemistry, has never been written in any language."—*Pharmaceutical Journal.*

"Must prove eminently useful to the chemical student."—*Athenæum.*

MACMILLAN AND CO., LONDON.

With 112 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18*s*.

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

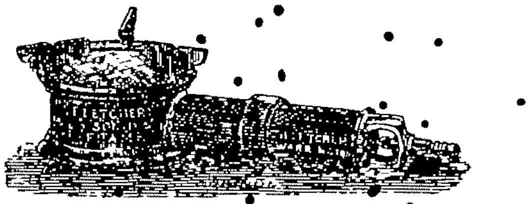
"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us Throughout the whole of it we are struck by the total absence of the defects so common in popular writings . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO., LONDON.

HOLLOWAY'S PILLS THIS MEDICINE

Is a Certain Cure for all Disorders of the LIVER, STOMACH AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints.

FLETCHER'S SOLID FLAME BURNER.



The most perfect heating burner for all purposes. It will with equal ease boil an egg, or melt half a hundredweight of lead in an iron pot. It will boil half a gallon of water in a flat copper kettle in six minutes, or melt 5 lbs lead in an iron ladle in the same time.

Price, Nickel plated, 5*s*. Japanned, 4*s*.

It can be made at a low cost, of *any shape, size, or power*

New and Enlarged List of Gas and Petroleum Heating Burners, Forges, Furnaces, Hot and Cold Blast Blowpipes, Ingot Moulds, Foot and Hand Blowers, &c. Price 3*d*. free by post.

UNIVERSITY COLLEGE, LONDON.

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION OF THE UNIVERSITY OF LONDON.

The following Classes meet the requirements of Candidates :—

Chemistry.—Prof. Williamson, Ph.D., F.R.S,
Experimental Physics.—Prof. G C. Foster, F.R.S.
Zoology —Prof. Lankester, M.A , F.R.S.
Botany and Vegetable Physiology.—Prof. Oliver, F.R.S., F.L.S.

The Courses of Chemistry, Practical Chemistry, and Botany enter into the ordinary Medical Curriculum, the extra fees amounting to 10 Guineas.

Prospectuses, including information as to Classes for Matriculation, may be obtained from the College, Gower Street, W.C.

TALFOURD ELY, M.A., Secretary.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. Ord, M.D., Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examination of the University of London Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

UNIVERSITY OF DURHAM COLLEGE OF PHYSICAL SCIENCE.

SESSION 1880–81.

Principal—W. Steadman Aldis, M.A.

The Classes, open to Students of both sexes, will begin on TUESDAY, October 12th, 1880.

Mathematics.—Prof. W. Steadman Aldis, M.A
Physics.—Prof. A. S. Herschel, M.A., F R.A.S.
Chemistry —Prof. A. Friere-Marreco, M A.
Geology.—Prof. G. A. Lebour, M A., F.G.S.
Natural History.—Prof. G S. Brady, M D , F.L.S.
Coal and Metal Mining —Prof. J. H. Merivale.
Modern History.—Prof. W. Moore Ede, M.A.

Also Classes in Land Surveying, Mechanical Drawing, and Modern Languages.

Students desirous of attending any of the Classes should apply at the Secretary's Office, Mining Institute, Westgate Road, Newcastle-on-Tyne, before September 25th, when the Scholarship, Matriculation, and Exhibition Examinations begin.

Information as to the above will be found in the Calendar of the College for the ensuing Session.

Information and advice as to the Course of Study for intending Students can be obtained from the Principal. Information on other points can be obtained on application to the Secretary, Mr. Theo. Wood Bunning, at the College.

Abstract Prospectus sent post free on application.

TO BE SEEN AT
E. WHEELER'S,
48, TOLLINGTON ROAD, HOLLOWAY, N.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25.

PRESIDENT-ELECT.
ANDREW CROMBIE RAMSAY, Esq., LL.D., F.R.S., V.P.G.S.,
Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section……………………" Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the ASSISTANT-SECRETARY, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

With 112 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18*s.*

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO, LONDON.

NORTH BRITISH AGRICULTURIST is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 100,000 Vols. of this series have been sold.

POPE. By LESLIE STEPHEN. Crown 8vo. *2s. 6d.*

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken. Readers who have made Pope a study and found his poetry a delight are not likely to accept all the terse and incisive criticisms scattered through these pages. Every reader, however, will acknowledge that an extremely difficult task has been well accomplished."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH. Crown 8vo. *2s. 6d.*

CHAUCER. By Prof. A. W. WARD. Crown 8vo. *2s 6d.*

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE. Crown 8vo. *2s. 6d.*

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum*

SOUTHEY. By Prof. DOWDEN. Crown 8vo. *2s 6d,*

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES. Crown 8vo. *2s. 6d.*

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON. Crown 8vo. *2s. 6d.*

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN. Crown 8vo. *2s. 6d.*

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay"—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON. Crown 8vo. *2s. 6d.*

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON. Crown 8vo. *2s. 6d.*

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS. Crown 8vo. *2s 6d.*

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S. Crown 8vo. *2s. 6d.*

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK. Crown 8vo. *2s. 6d.*

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as in his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. MINTO. Crown 8vo. *2s. 6d.*

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal SHAIRP. Crown 8vo. *2s. 6d.*

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S. Crown 8vo. *2s 6d.*

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE. Crown 8vo. *2s. 6d.*

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY. Crown 8vo. *2s. 6d.*

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

Others in Preparation.

MACMILLAN AND CO., LONDON.

Just published, in extra fcap. 8vo, price 4s 6d.

BLOWPIPE ANALYSIS:

By J. LANDAUER.

Authorised English Edition by JAMES TAYLOR and WILLIAM E. KAY, of the Owens College, Manchester.

The present English Translation contains the Author's latest Corrections and Additions, and has been printed under his personal supervision. Amongst the additions will be found the Author's Systematic Course of Analysis, an extended description of Bunsen's Flame Reactions, and the Reactions with Aluminium Plate proposed by Ross as a substitute for Charcoal.

CONTENTS.

Preface.
Examples for Practice.
Apparatus and Reagents.
The Operations of Blowpipe Analysis.
Bunsen's Flame Reactions.
Special Examination for Certain Elements in Combination
Systematic Examination of Compound Inorganic Substances.
Condensed View of the Blowpipe Reactions.
Tabular View of the Behaviour of the Earth, Alkalis, and Metallic Oxides, alone and with Reagents, before the Blowpipe.
Index.

MACMILLAN & CO., LONDON

To be published early in October. 8vo.

STUDIES on FERMENTATION. The Diseases of Beer: their Causes and the Means of Preventing them By L. PASTEUR A Translation of "Etudes sur la Bière," with Notes, Illustrations, &c. By F. FAULKNER and D. C. ROBB, B.A.

2. Words consisting of Short Letters.
3. Long Letters, with Words containing Long Letters. Figures.
4. Words containing Long Letters.

4a. Practising and Revising Copy-Book for Nos. 1 to 4.

5. Capitals and Short Half-text. Words beginning with a Capital.
6. Half-text Words beginning with a Capital. Figures.
7. Small-hand and Half-text, with Capitals and Figures.
8. Small-hand and Half-text, with Capitals and Figures.

8a. Practising and Revising Copy-Book for Nos. 5 to 8.

9. Small-hand Single Head Lines. Figures.
10. Small-hand Single Head Lines. Figures.
11. Small-hand Double Head Lines.
12. Commercial and *Arithmetical* Examples, &c.

12a. Practising and Revising Copy-Books for Nos. 8 to 12.

Nos. 1 to 9, and 11, may be had with Goodman's Patent Sliding Copies. Large post 4to, price *6d.* each.

By a simple device the copies, which are printed upon separate slips, are arranged with a movable attachment, by which they are adjusted so as to be directly before the eye of the pupil at all points of his progress It enables him also to keep his own faults concealed, with perfect models constantly in view for imitation. Every experienced teacher knows the advantage of the slip copy, but its practical application has never before been successfully accomplished. This feature is secured exclusively to Macmillan's Copy-books under Goodman's patent.

An inspection of books written on the old plan, with copies at the head of the page, will show that the lines last written at the bottom are almost invariably the poorest. The copy has been too far from the pupil's eye to be of any practical use, and the result is a repetition and exaggeration of his errors.

MACMILLAN & CO., LONDON.

HOLLOWAYS OINTMENT A CERTAIN REMEDY

For BAD BREASTS, OLD WOUNDS, and SORES. If effectually rubbed on the Neck and Chest, it cures SORE THROATS, BRONCHITIS, COUGHS and COLDS; and for GOUT, RHEUMATISM, and all Skin Diseases it is unequalled.

ELEMENTARY CLASS-BOOKS OF SCIENCE.

ASTRONOMY, by the Astronomer-Royal.

POPULAR ASTRONOMY. With Illustrations. By Sir G. B. Airy, K.C.B., Astronomer-Royal. New Edition. 18mo. 4*s.* 6*d.*

Six lectures, intended "to explain to intelligent persons the principles on which the instruments of an Observatory are constructed, and the principles on which the observations made with these instruments are treated for deduction of the distances and weights of the bodies of the Solar System."

ASTRONOMY.

ELEMENTARY LESSONS IN ASTRONOMY. With Coloured Diagram of the Spectra of the Sun, Stars, and Nebulæ, and ous Illustrations. By J. Norman Lockyer, F.R.S. New Edition. 18mo. 5*s.* 6*d.*

"Full, clear, sound, and worthy of attention, not only as a popular exposition, but as a scientific 'Index.'"—*Athenæum.*

QUESTIONS ON LOCKYER'S ELEMENTARY LESSONS IN ASTRONOMY. For the Use of Schools. By John Forbes-Robertson. 18mo, cloth limp. 1*s.* 6*d.*

PHYSIOLOGY.

LESSONS IN ELEMENTARY PHYSIOLOGY. With numerous Illustrations. By T. H. Huxley, F.R.S., Professor of Natural History in the Royal School of Mines. New Edition. 18mo. 4*s.* 6*d.*

"Pure gold throughout."—*Guardian.*

"Unquestionably the clearest and most complete elementary treatise on this subject that we possess in any language."—*Westminster Review.*

QUESTIONS ON HUXLEY'S PHYSIOLOGY FOR SCHOOLS. By T. Alcock, M.D. 18mo. 1*s.* 6*d.*

BOTANY.

LESSONS IN ELEMENTARY BOTANY. By D. Oliver, F.R.S., F.L.S., Professor of Botany in University College, London. With nearly Two Hundred Illustrations. New Edition. 18mo. 4*s.* 6*d.*

CHEMISTRY.

LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC AND ORGANIC. By Henry E. Roscoe, F.R.S., Professor of Chemistry in Owens College, Manchester. With numerous Illustrations and Chromo-Litho of the Solar Spectrum, and of the Alkalies and Alkaline Earths. New Edition. 18mo. 4*s.* 6*d.*

"As a standard general text-book it deserves to take a leading place."—*Spectator.*

"We unhesitatingly pronounce it the best of all our elementary treatises on Chemistry."—*Medical Times.*

A SERIES OF CHEMICAL PROBLEMS, prepared with Special Reference to the above, by T. E. Thorpe, Ph.D., Professor of Chemistry in the Yorkshire College of Science, Leeds. Adapted for the preparation of Students for the Government, Science, and Society of Arts Examinations. With a Preface by Professor Roscoe. New Edition, with Key, 18mo. 2*s.*

POLITICAL ECONOMY.

POLITICAL ECONOMY FOR BEGINNERS. By Millicent G. Fawcett. New Edition. 18mo. 2*s.* 6*d.*

"Clear, compact, and comprehensive."—*Daily News.*

"The relations of capital and labour have never been more simply or more clearly expounded."—*Contemporary Review.*

LOGIC.

ELEMENTARY LESSONS IN LOGIC; Deductive and Inductive, with copious Questions and Examples, and a Vocabulary of Logical Terms. By W. Stanley Jevons, M.A. Professor of Logic in University College, London. New Edition. 18mo. 3*s.* 6*d.*

"Nothing can be better for a school-book."—*Guardian.*

"A manual alike simple, interesting, and scientific."—*Athenæum.*

PHYSICS.

LESSONS IN ELEMENTARY PHYSICS. By Balfour Stewart, F.R.S., Professor of Natural Philosophy in Owens College, Manchester. With numerous Illustrations and Chromo-litho of the Spectra of the Sun, Stars, and Nebulæ. New Edition. 18mo. 4*s.* 6*d.*

"The beau-ideal of a scientific text-book, clear, accurate, and thorough."—*Educational Times.*

PRACTICAL CHEMISTRY.

THE OWENS COLLEGE JUNIOR COURSE OF PRACTICAL CHEMISTRY. By Francis Jones, Chemical Master in the Grammar School, Manchester. With Preface by Professor Roscoe, and Illustrations. New Edition. 18mo. 2*s.* 6*d.*

ANATOMY.

LESSONS IN ELEMENTARY ANATOMY. By St. George Mivart, F.R.S., Lecturer in Comparative Anatomy at St. Mary's Hospital. With upwards of 400 Illustrations. 18mo. 6*s.* 6*d.*

"It may be questioned whether any other work on anatomy contains in like compass so proportionately great a mass of information."—*Lancet.*

"The work is excellent, and should be in the hands of every student of human anatomy."—*Medical Times.*

STEAM.

AN ELEMENTARY TREATISE. By John Perry, Bachelor of Engineering, Whitworth Scholar, &c., late Lecturer in Physics at Clifton College. With numerous Woodcuts and Numerical Examples and Exercises. 18mo. 4*s.* 6*d.*

"The young engineer and those seeking for a comprehensive knowledge of the use, power, and economy of steam, could not have a more useful work, as it is very intelligible, well arranged, and practical throughout."—*Ironmonger.*

PHYSICAL GEOGRAPHY.

ELEMENTARY LESSONS IN PHYSICAL GEOGRAPHY. By A. Geikie, F.R.S., Murchison Professor of Geology, &c., Edinburgh. With numerous Illustrations. 18mo. 4*s.* 6*d.*

QUESTIONS ON THE SAME. 1*s.* 6*d.*

NATURAL PHILOSOPHY.

NATURAL PHILOSOPHY FOR BEGINNERS. By I. Todhunter, M.A., F.R.S. Part I. The Properties of Solid and Fluid Bodies. 18mo. 3*s.* 6*d.*

Part II. Sound, Light, and Heat. 18mo. 3*s.* 6*d.*

GEOGRAPHY.

CLASS-BOOK OF GEOGRAPHY. By C. B. Clarke, M.A., F.G.S. New Edition, with eighteen coloured Maps. Fcap. 8vo. 3*s.*

"Contains a large amount of information, systematically arranged."—*Examiner.*

SANITARY INSTITUTE OF GREAT BRITAIN,

9, CONDUIT STREET, W.

SANITARY CONGRESS.

The Sanitary Institute of Great Britain will hold its FOURTH CONGRESS at EXETER on September 21st, 1880, and following days

The Council invite Papers on subjects connected with Sanitary Science, including Engineering and Sanitary Construction, Meteorology and Geology, Sanitary Science, and Preventive Medicine. No previously-published Papers can be read. Each Author must prepare an Abstract of his Paper and send it, together with the original MSS., by *book post* on or before September 1st, addressed "SECRETARY, Sanitary Institute of Great Britain, 9, Conduit Street, Regent Street, W."

Authors whose Papers have been received and accepted will be furnished with printed copies before the commencement of the Congress.

DANIEL McCAY, Secretary.

August 4, 1880.

EXETER COLLEGE, OXFORD.

SCHOLARSHIPS.

An EXAMINATION will begin at this College on THURSDAY, October 14, at 10 a.m., for the purpose of filling up a Natural Science Scholarship. It will be of the value of £80 per annum, tenable for four years during residence. The age of the Candidates is not limited, but they will be expected to give evidence of sufficient classical knowledge to be able to pass Responsions. The Examination will be in Biology, Chemistry, and Physics. Candidates will be expected to show proficiency in at least two subjects, and the Scholar will be required to read for Honours in Biology in the Natural Science School. An estimate of the scope of the Examination may be formed by reference to the following text-books:—Ganot's "Physics," Newth's "Elements of Natural Philosophy," Roscoe's "Chemistry," Huxley and Martin's "Biology," Gegenbaur's "Elements of Comparative Anatomy," Sachs' "Handbook of Botany" (Books I. and II.), Spencer's "Principles of Biology." The Examination will be to a large extent practical, but special weight will be given to comprehension of general principles. Papers in Chemistry and Physics will be set in common with Trinity College, for the purpose of filling up a Scholarship also in that College.

Candidates for the Exeter Scholarship should call on the Rector on Wednesday, October 13, between 5 and 7 or 8 and 9 p.m., and will be considered to be also standing for the Millard Scholarship at Trinity College, unless they make a statement to the contrary. Candidates will be required to state which Scholarship they would prefer in the event of their election at both Colleges.

June, 1880.

UNIVERSITY COLLEGE, LONDON.

The SESSION of the FACULTY of MEDICINE will begin on MONDAY, October 4th.

The SESSION of the FACULTIES of ARTS and LAWS and of SCIENCE will begin on October 5th.

Instruction is provided for Women in all subjects taught in the Faculties of Arts and Laws and of Science.

Prospectuses and Copies of the Regulations relating to the Entrance and other Exhibitions, Scholarships, &c. (value about £2,000) may be obtained from the College, Gower Street, W.C.

The Examinations for the Entrance Exhibitions will be held on the 28th and 29th of September.

The School for Boys will reopen on September 21st.

The College is close to the Gower Street Station of the Metropolitan Railway.

TALFOURD ELY, M.A., Secretary.

NEW PORTABLE OR POCKET ASTRONOMICAL TELESCOPES.

Pocket Telescope with Object-Glass 1 in. diam., the body covered with Dark Green Morocco Leather. This Instrument has Three Drawers, and is 15 inches long when opened; it has a Day Eye-piece, a separate Astronomical Eye-piece, furnished with a Coloured Shade Glass for viewing the Sun. Price, in Case £0 12 6

Pocket Telescope, with Object-Glass 1¼ inches diam., the Body covered with Dark Green Morocco Leather; this Telescope has Three Drawers, and is 2 feet long when opened. It has a High Power Day Eye-piece and a separate Astronomical Eye-piece furnished with Coloured Shade Glass for Viewing the Sun. Price, complete in Case £1 2 6

Portable Telescope, as above, but with Object-Glass 1½ inches diam., and the Body 2½ feet long when opened, with High Power Day Eye-piece and separate Astronomical Eye-piece, &c. Price, in Case Complete £1 10 0

JOHN BROWNING,
OPTICIAN TO HER MAJESTY'S GOVERNMENT,
63, STRAND, LONDON, W.C.
ESTABLISHED MORE THAN 100 *YEARS.*
CATALOGUE OF TELESCOPES FREE.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. ORD, M.D., Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M B Examination of the University of London. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr. GILLESPIE.

W. M. ORD, M.D., Dean.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital.

ANDREW CLARK, Dean.

TELESCOPE.

A 2¼-inch ACHROMATIC PORTABLE TELESCOPE, by J. STEWARD, quite new, cost £13 14s., cash price £6 6s.

Three Powers, 30, 40, 50; Astronomical Eyepiece and Sun-Glass, Brass Stand, Leather Case and Sling, fitted in Mahogany Cabinet.

TO BE SEEN AT

E. WHEELER'S,

48, TOLLINGTON ROAD, HOLLOWAY, N.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.

OPEN SCHOLARSHIPS.

Three SCHOLARSHIPS are offered for Open Competition at St. Bartholomew's Hospital. The Examination will begin September 27th.

1. A Scholarship of the value of £130, open to Candidates under twenty-five years of age, and who have not entered at any Metropolitan Medical School. Subjects of Examination—Botany, Chemistry, Physics, Zoology.

2. A Scholarship of the value of £130, open to Candidates under twenty years of age. The other conditions and subjects are the same as the above.

3. The Jeaffreson Exhibition (value £50) open to Candidates who have not entered at any Metropolitan Medical School Subjects—Mathematics and Latin, and any two following languages at the option of the Candidates:—Greek, French, German. The successful Candidates will be required to enter at St. Bartholomew's Hospital.

4. Preliminary Scientific Exhibition—On October 21st there will be an Examination (limited to Students of the Hospital of less than six months' standing) for the above Exhibition, value £50 The subjects are those of the Preliminary Scientific Examination of the London University.

The successful Candidates for the above Four Scholarships are eligible in succeeding years for the Scholarships of the School, viz.:—First year, three (1) £50, (2) £30, (3) £20; Second year (1) £50; Third and Fourth year (1) £40, (2) £30, (3) £30, and for the several prizes

For further particulars application may be made personally or by letter to the WARDEN of the College, The College, St. Bartholomew's Hospital, E.C.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.

The WINTER SESSION will begin on FRIDAY, October 1st.

The Clinical Practice of the Hospital comprises a service of 710 beds, inclusive of 34 beds for convalescents at Highgate

Students can reside within the Hospital, subject to College regulations.

For all particulars application may be made to the WARDEN of the College, The College, St. Bartholomew's Hospital, E.C.

A Handbook forwarded on application.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25.

PRESIDENT-ELECT.

ANDREW CROMBIE RAMSAY, ESQ., LL.D., F.R.S., V.P.G.S.,
Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section……………………" Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the ASSISTANT-SECRETARY, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

EAGLE INSURANCE COMPANY,

79, PALL MALL.

The Library contains 90,000 Volumes of Ancient and Modern Literature, in various languages. Subscription, £3 a year, or £2 with Entrance Fee of £6; Life Membership, £26. Fifteen Volumes are allowed to Country and Ten to Town Members. Reading Rooms open from Ten to Half-past Six. Catalogue, *new edition*, 1875 (1,062 pp.), price 16s.; to Members, 12s. Prospectuses on application.

ROBERT HARRISON, Secretary and Librarian.

GERMAN SCIENCE TEACHER.—A Son of Dr Hermann Müller, of the Lippstadt Realschule, and well known to the readers of NATURE, desires to obtain a post in a good English school or college. Herr Muller, Jun, has acquired from a Prussian Board of Examination the qualification to teach Mathematics, Physics, Chemistry, and Natural History, and has been for three years a teacher in the same school as his father. Herr Muller is desirous of becoming more thoroughly acquainted with the English language and English educational institutions, and therefore would be satisfied with a moderate salary. Apply to Dr. HERMANN MULLER, Oberlehrer, Lippstadt, Germany.

On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST. is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d.* Annual Subscription, payable in advance, 14*s.*
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

Established 1843.

MACMILLAN & CO., BEDFORD STREET, STRAND, W.C.

STANDARD AND OBSERVATORY TIMEKEEPERS.

TRADE DENT MARK MANUFACTURED BY E. DENT & CO. TRADE DENT. MARK

	Guineas.
Standard Clock, suitable for Private Residences in Town or Country, or Public Institutions, beating seconds and going eight days with once winding; in carved and decorated oak or mahogany case ... ... from	35
(*a*) The same, but going one month with once winding ... ... from	40
Standard Observatory Mean-time Clock	80
(*a*) The same, but furnished with electrical contact apparatus with eccentric screw adjustments for dropping a time ball, or transmitting hourly signals	92
Standard Observatory Sidereal Clock	80
(*a*) The same, but furnished with electrical contact apparatus with fine vertical and horizontal screw adjustments for transmitting seconds, currents for controlling other clocks, &c.	95
(*b*) The same, but arranged to omit the current at every 60th second, for pricking on chronograph barrel, &c.	97

	Guineas.
Standard Observatory Clock, of the most refined construction, with barometric compensation, &c. ...	160
(*a*) The same, with Sir Geo. Airy's escapement ...	170
(*b*) The same, with M. Leverrier's electrical contact system	200

The New Standard Clock (the primary standard timekeeper of the United Kingdom) of the Royal Observatory, Greenwich, was constructed by E. Dent & Co., and precisely similar instruments are now being made for the Royal Observatories of Spain and Belgium. Standard Clocks of less refined construction for the Observatories of Edinburgh (Royal), Dunsink (Royal Irish), Oxford (University), Pulkowa (Russian Imperial), Geneva (National Swiss); and many others, Foreign and Colonial, have been manufactured.

Galvanic Chronographic Apparatus, for registering the time of occurrence of transits and other astronomical phenomena ... ... from	120

The Great Galvanic Chronograph of the Royal Observatory, Greenwich, and the still more powerful Apparatus for the Royal Observatory, Brussels, and other smaller ones for other Observatories were constructed by E. Dent & Co.

E. DENT & CO.,
WATCH, CLOCK, AND CHRONOMETER MAKERS,
61, STRAND, & 34, ROYAL EXCHANGE. FACTORY, GERARD STREET, LONDON.

CHEMICAL APPARATUS—SCIENTIFIC INSTRUMENTS.

Apparatus for the Analysis of Water according to Professors Frankland and Bischof.

BUNSEN'S MODIFIED FILTER PUMPS, from 10s. 8d. to 67s.

ELECTRIC LAMPS FROM 35s. UPWARDS, AND BATTERY OF 40 QUART BUNSEN'S CELLS FOR SAME AT £8.

GEISSLER'S TUBES.

Catalogues and Illustrations will be sent gratuitously. *A Liberal Discount allowed to Wholesale Buyers.*

Sets of Apparatus according to Professor Valentin's "Book of Chemistry," Professor Attfield's "Manual of Chemistry," &c., always in stock.

WHOLESALE IMPORTERS AND MANUFACTURERS,

AUG. BEL and CO.,

Sole Agents for Grenet's Batteries, and Contractors to the Government.

34, Maiden Lane, Southampton St., Strand, W.C.

Sets of Apparatus as required by the Government Schools always ready and kept in stock.

CAILLETET'S APPARATUS FOR LIQUEFACTION OF GASES.

For the convenience of Teachers and Students at the South Kensington Classes, the Science and Art Department has authorized us to keep a stock in the store-room, first floor of the building, where the different sets and other articles are always ready for delivery.

MICROSCOPIC SPECIALITIES.

Series I.—24 Medical Pathological Preparations, in Case	£2	2	0

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

ST. BARTHOLOMEW'S HOSPITAL AND COLLEGE.

OPEN SCHOLARSHIPS.

Three SCHOLARSHIPS are offered for Open Competition at St Bartholomew's Hospital. The Examination will begin September 27th.

1. A Scholarship of the value of £130, open to Candidates under twenty-five years of age, and who have not entered at any Metropolitan Medical School. Subjects of Examination—Botany, Chemistry, Physics, Zoology

2. A Scholarship of the value of £130, open to Candidates under twenty years of age The other conditions and subjects are the same as the above.

3 The Jeaffreson Exhibition (value £50) open to Candidates who have not entered at any Metropolitan Medical School. Subjects—Mathematics and Latin, and any two following languages at the option of the Candidates:—Greek, French, German. The successful Candidates will be required to enter at St. Bartholomew's Hospital.

4. Preliminary Scientific Exhibition —On October 21st there will be an Examination (limited to Students of the Hospital of less than six months' standing) for the above Exhibition, value £50. The subjects are those of the Preliminary Scientific Examination of the London University

The successful Candidates for the above Four Scholarships are eligible in succeeding years for the Scholarships of the School, viz :—First year, three (1) £50, (2) £30, (3) £20, Second year (1) £50; Third and Fourth year (1) £40, (2) £30, (3) £30, and for the several prizes

For further particulars application may be made personally or by letter to the Warden of the College, The College, St. Bartholomew's Hospital, E.C.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. Ord, M.D, Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M B. Examination of the University of London. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M D., Dean.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital.

ANDREW CLARK, Dean.

The CHEMISTRY LECTURER at Clifton College will want an ASSISTANT in September.—For further particulars apply, with references, to W. A. Shenstone, Easterly, Wells, Norfolk.

DEFECTIVE VISION,

EITHER NATURAL OR CAUSED BY DISEASE.

Mr. John Browning begs to state that he has for years been honoured with the recommendation of our leading oculists for supplying Spectacles, Eye-Glasses, and Binoculars for all peculiarities of vision.

Mr. Browning can work lenses for special cases and make special frames when required at twenty-four hours notice.

PRICE OF SPECTACLES FROM 4*s.* 6*d.* PER PAIR.

JOHN BROWNING,

Optical and Physical Instrument Maker to H.M. Government, the Royal Society, the Royal Observatories of Greenwich and Edinburgh, and the Observatories of Kew, Cambridge, Durham, Utrecht, Melbourne, &c., &c.

63, STRAND, LONDON, W.C.

FACTORY—Southampton Street, London, W.C.

ESTABLISHED MORE THAN 100 *YEARS.*

KINDERGARTEN TRAINING COLLEGE,

31, TAVISTOCK PLACE, LONDON, W.C.

The AUTUMN TERM begins September 16th.

For the Prospectus and Form of Entry, apply to the Hon. Sec., Miss Hart, 86, Hamilton Terrace, London, N.W.

UNIVERSITY COLLEGE, LONDON.

DEPARTMENT OF APPLIED SCIENCE AND TECHNOLOGY.

Engineering and Mechanical Technology.—Prof. Alex B. W. Kennedy, M Inst. C.E., M Inst. M.E.

Chemical Technology.—Prof. Charles Graham, D.Sc., F.I C

LECTURES commence October 6th, and Practical Work in Engineering and Chemical Laboratories at the same date.

Prospectuses may be obtained from the College, Gower Street, W.C.

TALFOURD ELY, M.A., Secretary

Rev. W. TUCKWELL, late Head Master of Taunton College School, and Fellow of New College, Oxford, takes a FEW BOYS AS PUPILS. Preparation for the Civil Service and the Oxford and Cambridge Certificate.—Address, Stockton Rectory, near Rugby.

TELESCOPE.

A 2¾-inch ACHROMATIC PORTABLE TELESCOPE, by J. STEWARD, quite new, cost £13 14s., cash price £6 6s.

Three Powers, 30, 40, 50; Astronomical Eyepiece and Sun-Glass, Brass Stand, Leather Case and Sling, fitted in Mahogany Cabinet.

TO BE SEEN AT
E. WHEELER'S,
48, TOLLINGTON ROAD, HOLLOWAY, N.

BRITISH ASSOCIATION
FOR THE
ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at SWANSEA, commencing on WEDNESDAY, August 25.

PRESIDENT-ELECT
ANDREW CROMBIE RAMSAY, Esq., LL.D., F.R.S., V.P.G.S.,
Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting.* It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before July 24, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section........................." Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instrusted to individuals or Committees, must be forwarded to the ASSISTANT-SECRETARY, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Report of the Association unless it is in the Assistant-Secretary's hands before the conclusion of the Meeting. J. E. H. GORDON, Assistant-Secretary.

TO BE SOLD.—Superior EQUATORIAL

TELESCOPE by Dollond; 2¾ object, clear aperture with perfect definition; Eyepieces, 40, 70, 110, 165; brass mounting Universal; strong Tripod Stand, and accessories Price £35.—Address W., NATURE Office.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

EAGLE INSURANCE COMPANY,

79, PALL MALL.
FOR LIVES ONLY. ESTABLISHED 1807.

Accumulated Funds £3,043,542
Also a Subscribed Capital of more than £1,500,000

GEORGE HUMPHREYS, Actuary and Secretary.

FIRST-CLASS AND THIRD-CLASS AWARDS

AT SYDNEY EXHIBITION
For Collections for Teachers and Students, of
MINERALS, FOSSILS, AND ROCKS

Used with success by all Geological Science Teachers in the United Kingdom. Single Specimens, Hammers, and all requisites, of

JAMES R. GREGORY,
Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.
New Lists of Collections, Apparatus, Rock Sections, &c., post free.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address:—CASTLETON, *via* SHEFFIELD.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

12, FRITH STREET, SOHO, W.

DIAMONDS AND OTHER PRECIOUS

STONES. Scientific opinion given as to GENUINENESS, PURITY, and VALUE.—BRYCE WRIGHT, 90, Great Russell Street, London.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, MICROSCOPIST'S and NATURALIST'S STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers *Alcyonella fungosa*, with drawing and description. He has also sent out *Leptodora hyalina*, *Hyalodaphnia Kahlbergensis*, *Argulus foliaceus*, *Ophrydium versatilis*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.
Price List of Specimens on application, with stamped addressed envelope.
Portfolio of Drawings, No. 3, One Shilling.

NEW PRICE LIST.
OF
ELEMENTARY COLLECTIONS
OF
FOSSILS, ROCKS, AND MINERALS, APPARATUS, &c.

POST FREE.

THOMAS J. DOWNING,
38, WHISKIN STREET, ST. JOHN STREET ROAD,
CLERKENWELL.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS OF
PHOSGENITE AND CRYSTALLISED
ULLMANNITE, Sardinia; also
CRYSTALLISED CALEDONITE, LANARKITE,
ANGLESITE, and LEADHILLITE, Scotland;
EUXENITE, ENSTATITE, CYPRINE, Norway;
GREEN WAVELLITE, BROOKITE,
PECTOLITE, America.

COLLECTIONS FOR STUDENTS, from £2 2s.
COLLECTIONS FOR BEGINNERS, from 4s.
BLOWPIPE CASES AND APPARATUS
PRIVATE LESSONS AND EVENING CLASSES.
Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

GEOLOGY OF WEYMOUTH AND PORTLAND,

With FIGURES, SECTIONS, COAST VIEWS, and NOTES on the NATURAL HISTORY of the COAST. 3s. 6d.
Or with GEOLOGICAL MAP, 5s., post free.
By R. DAMON, F.G.S., Weymouth.

ALSO,
New and greatly Enlarged Edition of ATLAS to the above. Price 6s.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

Advertisements 4d. a line, widely spread by this paper; considerable abatement for 3, 6, 12 months' insertion. Business Office: Aug. Meyer and Dieckmann, Hamburg, Alterwall, 28. Edited by W. v. FREEDEN, M.R., Hamburg, Alexander Street, 8.

On the 1st of every Month.

Now ready, price 3s. 6d., Part X. of

BRAIN:

A QUARTERLY JOURNAL OF NEUROLOGY.

EDITED BY
J. C. BUCKNILL, M.D., F.R.S., J. CRICHTON-BROWNE, M.D., F.R.S.E., D. FERRIER, M.D., F.R.S., AND J HUGHLINGS-JACKSON, M.D., F.R.C.P.

Contents.

ORIGINAL ARTICLES:—
- On the Form and Topographical Relations of the Corpus Striatum. By Professor J. C. Dalton (New York).
- Nystagmus. By R. P. Oglesby.
- On Muscular Spasms known as "Tendon-Reflex." By A. Waller, M.B.
- On Right- or Left-sided Spasm at the Onset of Epileptic Paroxysms, &c. By J. Hughlings-Jackson, M.D. F.R.S.
- Notes on Left-handedness. By William W. Ireland, M.D.

CRITICAL DIGESTS AND NOTICES OF BOOKS:—
- Bastian on the Brain as an Organ of Mind. By John Charles Bucknill, M.D., F.R.S.
- Lindsay on Mind in the Lower Animals, in Health and Disease. By F. L. Benham, M.B.
- Landouzy on Paralysis in Acute Disease. By A. de Watteville, M.A., B.Sc.
- Mickle on General Paralysis of the Insane. By J. C. Bucknill

CLINICAL CASES:—
- Case of Microcephalic Idiocy. By A. R. Urquhart, M.D.
- Case of Cerebral Tumour. By Arthur W. Fox, M.B., and Ernest Field, M.B.

ABSTRACTS OF BRITISH AND FOREIGN JOURNALS:—
- Method of Preserving the Brain (Giacomini). By Allen Thomson, F.R.S.
- Krueg on the Sulci of the Zonoplacental Mammalian Brain. By H. Obersteiner.
- *Féré sur le Développement du Cerveau, &c.* Amidon on a New Study of Cerebral Localisation. By A. Waller, M.B.
- Visceral Neurology. By J. Mitchell Bruce, M.D.
- Buzzard on certain Points in Tabes Dorsalis. By J. Hughlings-Jackson
- Abstracts of the Gulstonian Lectures on Epilepsy. By W. R. Gowers, M.D.
- On the Disease called Sturdy in Sheep, in its Relation to Cerebral Localisation. By George T. Beatson, B.A., M.D.
- Tripier on Anæsthesia from Cortical Lesions. Sommer on Diseases of the Cornu Ammonis. By D. Ferrier.

MACMILLAN & CO., London.

Now ready, Vol. XIV., Part IV., price 6s.

THE JOURNAL OF ANATOMY AND PHYSIOLOGY

NORMAL AND PATHOLOGICAL.

CONDUCTED BY
Profs. HUMPHRY, TURNER, M'KENDRICK, & Dr. CREIGHTON.
This Volume contains 30 Plates and numerous Woodcuts

Contents.

1. Rete Mirabile of Narwhal. By H. S. Wilson, M.D. (Plates XXI. XXIII.)
2. Coronary Veins of Stomach. By W. J. Walsham, F.R.C.S. (Plate XXIV.)
3. Coronary Veins of Stomach. By Prof. Turner
4. Communication between Air-Bladder and Cloaca in Herring. By F. W. Bennett.
5. Curvatores Coccygis Muscles of Man. By Prof. M. Watson.
6. Valvular Hæmatoma. By G. A. Gibson, M.B. (Plate XXV.)
7. Pathology of *Macroglossia* and *Hygroma*. By R. Maguire. (Plate XXVI.)
8. Changes in Spinal Cord after Amputation of Limbs. By. J. Dreschfeld, M.D. (Plate XXVI.)
9. Morbid Anatomy of Post-Scarlatinal Nephritis. By B. C. Waller, M.D. (Plate XXVII.)
10. Antagonism of Opium and Belladonna. By J. G. Naismyth, M.B.
11. Presence of Astragalo-Scaphoid Bone in Man. By R. J. Anderson, M.D.
12. Mode of Healing in Wounds under Antiseptic Dressings. By D. Foulis, M.D.
13. Respiratory Movements of Fishes. By Prof. M'Kendrick. (Plate XXVIII.)
14. Anatomy of the Porpoise. By G. B. Howes. (Plate XXIX.)
15. Two Masks and Skull from Islands near New Guinea. By Prof. Turner. (Plate XXX.)
16. Effect of Anæsthetics on Pulmonary Circulation. By D. Newman, M.B.
17. Method of Preserving Colours of Tissues. By H. Bendall.
18. Variations in Myology. By J. Macdonald Brown.
19. Anatomical Notices. By G. A. Gibson

MACMILLAN & CO., London and Cambridge.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

THE NEW BIOLOGICAL JOURNAL.

ARCHIVES DE BIOLOGIE.

Edited by Professors EDOUARD VAN BENEDEN of Liège, and VAN BAMBEKE of Ghent.

This Journal is devoted to the publication of original Memoirs on the Embryology, Histology, Physiology, and Comparative Anatomy of Plants and Animals. Each number is illustrated with numerous Coloured Plates, and appears at the commencement of the Quarter

Price:—A Single Number, Six Shillings and Sixpence. Annual Subscription: Twenty-five Shillings, or Twenty-seven Shillings post free.

Orders received by Messrs. WILLIAMS & NORGATE, 14, Henrietta Street, Covent Garden, London

In the first two numbers have appeared:—
- VAN BENEDEN: On the Embryology of the Mammalia
- VAN BAMBEKE: On the Cleavage of the Egg in Batrachia.
- FOE HINGER: On the Termination of Nerves in the Muscles of Insects
- FREDERIQUE AND VANDEVELDE: On the Physiology of the Muscles and Nerves of the Lobster.
- MACLEOD: On the Harderian Gland of the Duck, &c., &c

With 112 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY
PROFESSOR S. NEWCOMB, LL.D.
8vo, cloth, price 18s.

"As affording a thoroughly reliable foundation for more advanced reading, Prof. Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO., LONDON.

LA SEMAINE FRANÇAISE: a Weekly Newspaper and Review in the French Language. Politics, Literature, Science, Art, Varieties, Notes. Price 3d., through booksellers, and at the railway bookstalls. Office, 37, Southampton Street, Strand, W.C.

LA SEMAINE FRANÇAISE: Journal Française pour l'Angleterre: Politique, Littérature, Sciences, Arts, Variétés, Nouvelles, et Notes. Un exemplaire par la poste, 3½d., en timbres poste. Abonnement franco par la poste—un an, 15s 2d., six mois, 7s. 7d. Prix 3d., chez tous les libraires et aux gares des chemins de fer. On s'abonne aux bureaux, 37, Southampton Street, Strand, Londres, W.C.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most than any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

TERMS OF SUBSCRIPTION:—	s.	d.
Three months	3	10
Six ,,	7	7
Twelve ,,	15	2

P.O.O. payable to T. SPANSWICK, at King Street, Covent Garden, W.C.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly Lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

Now publishing, in Crown 8vo Price 2s. 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 100,000 Vols. of this series have been sold.

BYRON. By PROF. JOHN NICHOL. Cr. 8vo. 2s. 6d.

POPE. By LESLIE STEPHEN. Crown 8vo. 2s. 6d.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH. Crown 8vo. 2s. 6d.

CHAUCER. By Prof. A. W. WARD. Crown 8vo. 2s. 6d.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE. Crown 8vo. 2s. 6d.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN. Crown 8vo. 2s 6d,

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES. Crown 8vo. 2s 6d.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON. Crown 8vo. 2s 6d.

"Mr Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN. Crown 8vo. 2s. 6d.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON. Crown 8vo. 2s. 6d.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON. Crown 8vo. 2s 6d

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS. Crown 8vo. 2s. 6d.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S. Crown 8vo. 2s. 6d.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK. Crown 8vo. 2s. 6d.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. MINTO. Crown 8vo. 2s. 6d.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal SHAIRP. Crown 8vo. 2s. 6d.

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S. Crown 8vo. 2s. 6d.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE. Crown 8vo 2s. 6d.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY. Crown 8vo. 2s. 6d.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

Others in Preparation.

MACMILLAN AND CO., LONDON.

Now ready, post quarto, cloth gilt, 272 pages. Price 16s.

LIGHTNING CONDUCTORS:

THEIR

HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street 1880.

A PHYSICAL TREATISE on ELECTRICITY and MAGNETISM. By J. E. H. GORDON, B A. Cambridge, Assistant-Secretary of the British Association. 2 vols., demy 8vo, cloth extra, 36s.

"Perhaps the best text-book ever done."—*Vanity Fair.*

SAMPSON LOW, MARSTON, SEARLE, & RIVINGTON, Crown Buildings, 188, Fleet Street, London, E.C.

Published THIS WEEK, demy 8vo, price 12s. 6d., post free.

TRANSCENDENTAL PHYSICS:

AN

ACCOUNT OF EXPERIMENTAL INVESTIGATIONS.

From the Scientific Treatises of

JOHANN CARL FRIEDRICH ZÖLLNER,

Professor of Physical Astronomy at the University of Leipsic.

Translated, with a Preface and Appendices, by

CHARLES CARLETON MASSEY, of Lincoln's Inn, Barrister-at-Law.

Illustrated by various Full-page and Double-page Engravings.

W. H. HARRISON, 33, Museum Street, London, W.C.

NEWMAN'S BUTTERFLIES & MOTHS, Newly bound, half morocco, 15s "Forces of Nature," translated by Mrs. NORMAN LOCKYER, newly bound, half calf, 15s Hugh Miller's Works, 12 vols., £1 9s, published at £3. Bridgewater Treatises (Pickering's), 12 vols., £1 7s.—J. TEAL, 16, Southgate, Halifax.

The MORPHOLOGY of the SKULL. By W. K. PARKER, F.R.S., Hunterian Professor, Royal College of Surgeons, and G. T. BETTANY, B.Sc., Lecturer on Botany in Guy's Hospital Medical School. Illustrated. Crown 8vo. 10s. 6d.

MACMILLAN & CO., London.

To be published early in October. 8vo

STUDIES on FERMENTATION. The Diseases of Beer: their Causes and the Means of Preventing them. By L. PASTEUR. A Translation of "Etudes sur la Bière," with Notes, Illustrations, &c. By F. FAULKNER and D. C. ROBB, B.A.

MACMILLAN & CO., LONDON.

SWISS LAKE-DWELLINGS.

MR. BRYCE-WRIGHT, at present on a tour through the Swiss Lakes, will have the honour of offering for sale in a few days a

MAGNIFICENT COLLECTION OF IMPLEMENTS, containing many unique Bronze and Stone Weapons.

THE YEAR'S ART:

A Concise Epitome of all matters relating to the Arts of PAINTING, SCULPTURE, and ARCHITECTURE which have occurred during the year 1879, together with information respecting the events of the year 1880.

Compiled by MARCUS B. HUISH, LL.B.

"This little volume of statistics and information will be of service to many readers, and the compiler has done his work well."—*Pall Mall Gazette.*

"It contains a great deal of useful information arranged in a way which makes reference easy."—*Athenæum.*

"This new handbook supplies what has hitherto been a void in year-books, and deserves, nor can we doubt that it will obtain, a large share of popular support. . . . As far as we have been able to test Mr. Huish's volume, it admirably fulfils its purpose."—*John Bull.*

"Let us conclude this notice by heartily thanking Mr. Huish for his excellent handbook. It is sold at half-a-crown; we would willingly have given a guinea for it, and only regret it was not thought of sooner."—*Portfolio.*

A. B. SHEPHERD, M.D., Dean of the School.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

ROYAL COLLEGE OF SCIENCE FOR IRELAND,

STEPHEN'S GREEN, DUBLIN.

SCIENTIFIC AND TECHNICAL EDUCATION.

SESSION 1880–81.

This College supplies a complete Course of Instruction in Science, applicable to the Industrial Arts, especially those which may be classed broadly under the heads of CHEMICAL MANUFACTURES, MINING, and ENGINEERING

A Diploma of Associate of the College is granted at the end of the Three Years' Course.

There are Four Royal Scholarships of the value of £50 each yearly, with free education, including Laboratory Instruction, tenable for two years Two become vacant each year. They are given to Students who have been a year in the College.

The Fees are £2 for each Course, or £10 for all the Courses of each year, with the exception of Laboratory Practice.

CHEMISTRY (THEORETICAL AND PRACTICAL), METALLURGY, &c.—Prof. HARTLEY, F.C.S.

MATHEMATICS, MECHANICS, AND MECHANISM.—Prof. HENNESSY, F.R.S

DESCRIPTIVE GEOMETRY, DRAWING, ENGINEERING, AND SURVEYING.—Prof. PIGOT, C.E., M.R I.A.

EXPERIMENTAL PHYSICS (THEORETICAL AND PRACTICAL) — Prof. BARRETT, F R.S.E , F.C S.

MINING AND MINERALOGY.—Prof. O'REILLY, C.E., M.R.I.A.

BOTANY.—Prof. M'NAB, M D., F.L.S.

ZOOLOGY.—Prof. BRIDGE, M.A , F.Z.S.

GEOLOGY.—Prof. HULL, M.A , F R.S.

PALÆONTOLOGY.—Mr BAILY, F.G S.

The Chemical and Physical Laboratories and Drawing School are open daily for Practical Instruction.

Fee for Chemical Laboratory, £2 per Month, or £12 for Session. Fee for Physical Laboratory, £1 per Month, or £6 for Session. Fee for Drawing School, £3 for Session.

The SESSION COMMENCES on MONDAY, October 4th.

Programmes may be obtained on application at the College, or by letter or post-card, addressed to the Secretary, Royal College of Science, Stephen's Green, Dublin.

W. E. STEELE, M D , Secretary *pro. tem.*

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. ORD, M.D , Dean of the School, at 3 p m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M B Examination of the University of London. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr GILLESPIE.

W. M ORD, M.D., Dean.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital.

ANDREW CLARK, Dean.

GUY'S HOSPITAL MEDICAL SCHOOL.

OPEN SCHOLARSHIPS

A SCHOLARSHIP of the value of 125 Guineas will be offered for OPEN COMPETITION on FRIDAY, September 24th. Subjects of Examination—Classics, Mathematics, and Modern Languages.

A Second SCHOLARSHIP, also of the value of 125 Guineas, will be offered for Open Competition on the same day. Subjects of Examination—Inorganic Chemistry, Physics, Botany, and Zoology.

For further particulars apply to the DEAN, Guy's Hospital, S.E.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra; Ground edged Slips, 5s. per gross; also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, MICROSCOPIST'S and NATURALIST'S STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers *Argulus foliaceus*, with drawing and description. He has also sent out *Cristatella mucedo, Paludicella Ehrenbergi, Volvox globator, Bacillaria paradoxa*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

WANTED.—A LECTURESHIP in NATURAL SCIENCE, or to conduct Evening Classes in connection with the Science and Art Department. Undergraduate (1st B.Sc) of London, Scholar of King's College, Holder of fifteen Advanced and Honours Certificates from South Kensington.—Address W. R., 4, Trinity Terrace, Bow, E.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

CONCHOLOGY, &c.—A Small Collection of SHELLS which have been classified by a Skilled Judge, some interesting Minerals, and a few Oil Paintings by eminent masters, for SALE.—Apply by letter, G. H. G , 31, Tavistock Street, Covent Garden.

COMPARATIVE PALÆONTOLOGY.—Types of Carboniferous Polyzoa, 5 Genera and 12 Species on Slide, 1s 9d.; Types of Reuss's *Idmonea, Hornera*, and *Pustulopora*, 3 Species on Slide, 1s. 3d., post free.—G R. VINE, Attercliffe, Sheffield.

FIRST-CLASS AND THIRD-CLASS AWARDS

AT SYDNEY EXHIBITION

For Collections for Teachers and Students, of

MINERALS, FOSSILS, AND ROCKS

Used with success by all Geological Science Teachers in the United Kingdom. Single Specimens, Hammers, and all requisites, of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square.

New Lists of Collections, Apparatus, Rock Sections, &c , post free.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS OF

PHOSGENITE AND CRYSTALLISED ULLMANNITE, Sardinia; also

CRYSTALLISED CALEDONITE, LANARKITE, ANGLESITE, and LEADHILLITE, Scotland;

EUXENITE, ENSTATITE, CYPRINE, Norway;

GREEN WAVELLITE, BROOKITE, PECTOLITE, America.

COLLECTIONS FOR STUDENTS, from £2 2s.

COLLECTIONS FOR BEGINNERS; from 4s.

BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

"The leading Farmers paper."—CLARE SEWELL READ, ESQ, M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture, *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

LA SEMAINE FRANÇAISE: a Weekly

With 112 Engravings and 5 Maps of the Stars.
POPULAR ASTRONOMY.
BY
PROFESSOR S. NEWCOMB, LL.D.
8vo, cloth, price 18*s.*

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

MACMILLAN & CO, LONDON.

HOLLOWAY'S PILLS THIS MEDICINE

Is a Certain Cure for all Disorders of the LIVER, STOMACH, AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints.

FLETCHER'S
SOLID FLAME BURNER

Will with equal ease boil an egg in a small tin saucepan, or melt half a hundredweight of lead in an iron pot. It will boil half a gallon of water in a flat copper kettle in six minutes, and will melt 6 lbs. of lead or solder in an iron ladle in seven minutes.

Price, Japanned, 4s. Nickel plated, 5s.

Complete List of GAS FURNACES for all purposes, Hot and Cold Blast BLOWPIPES, Automatic, Foot, and Hand BLOWING APPARATUS, INSTANTANEOUS WATER HEATERS, &c. Price 3*d.* post free, with reprint of Mr. Fletcher's paper on the Application of Gaseous Fuel to Laboratory Work, to which was awarded the Silver Medal of the Society of Arts.

Life and Letters of John T. Delane, late Editor of the *Times*. By Sir GEORGE W. DASENT D.C.L. 8vo.

MACMILLAN AND CO., LONDON.

CASSELL, PETTER, GALPIN & CO.'S ANNOUNCEMENTS.

AN ENTIRELY NEW EDITION.

In Monthly Parts, price 1*s*.

PAXTON'S FLOWER GARDEN,

By PROF. LINDLEY and SIR JOSEPH PAXTON.

Thoroughly Revised and brought down to the present date by MR. THOMAS BAINES, F.R.H.S., with many entirely NEW COLOURED PLATES, executed expressly for this Edition.

Part I. ready August 25.

This New Issue of PAXTON'S FLOWER GARDEN will be revised and brought down to date, both as regards the text and illustrations. Many entirely new Coloured Plates will be expressly executed by the best artists, from paintings made from nature and produced in facsimile colours, of the most remarkable plants recently introduced into cultivation. The descriptive letterpress will be amended and altered in accordance with the latest botanical researches, Mr. Baines supplying fresh original matter descriptive of the New Coloured Plates, and adding whatever recent information may be found desirable.

⁂ *Prospectuses at all Booksellers, or post free from the Publishers.*

NEW BOOKS AND NEW EDITIONS.

THE NEW AND CHEAP EDITION.

LIFE OF RIGHT HON. W. E. GLADSTONE. By Barnett Smith. A SEVENTH EDITION is now ready, price 5*s*.

OUR OWN COUNTRY. Vols. I. and II. now ready, each complete in itself, and containing upwards of **200 ORIGINAL ILLUSTRATIONS,** and Steel Frontispiece. Extra crown 4to, cloth, price 7*s*. 6*d*. each.

"Altogether 'Our Own Country' is a charming book, well calculated to give a good idea of the beauties of our island town and scenery."—*Morning Post.*

SHORTER WORKS IN ENGLISH PROSE. By Prof. Henry Morley. Being Vol. IV. of "CASSELL'S LIBRARY OF ENGLISH LITERATURE." With Original Illustrations, price 11*s*. 6*d*.

"A very useful and valuable 'Library of English Literature.' It is difficult to give an idea of the industry, reading, and judgment which have contributed to produce this volume."—*Spectator.*

GREAT INDUSTRIES OF GREAT BRITAIN, with about 400 Illustrations, is now ready, complete in 3 vols. price 7*s*. 6*d*. each.

CANARIES AND CAGE BIRDS, the ILLUSTRATED BOOK OF, with 56 Facsimile Coloured Plates, is now published complete in one handsome volume, demy 4to, cloth, price 35*s*.; or half morocco, 45*s*.

The *Times*, in reviewing this volume in its issue of July 22, remarked:—"Altogether the book is a perfect encyclopædia on everything relating to the subjects of which it treats, and the plates may be studied with no little profit by those who desire to become practical naturalists."

FIELD NATURALIST'S HANDBOOK, The. By Rev. J. G. Wood and THEODORE WOOD. Second Edition now ready. 5*s*.

Now ready, price 12s. 6d.

FAMILIAR WILD FLOWERS.

SECOND SERIES, COMPLETE IN ONE VOLUME.

BY F. E. HULME, F.L.S., F.S.A.

Containing 40 full-page **COLOURED PLATES,** with Descriptive Text.

"An elegant table-book, decorated with choice coloured figures of some of the most interesting of our native flowers, and supplying the kind of information concerning them which the general reader is likely to appreciate."—*Florist.*

"A delightful book, daintily got up, its forty Coloured Plates carefully done, and the letterpress rich in new and varied information. Botany with Mr. Hulme will add zest to many an otherwise dull walk."—*Graphic.*

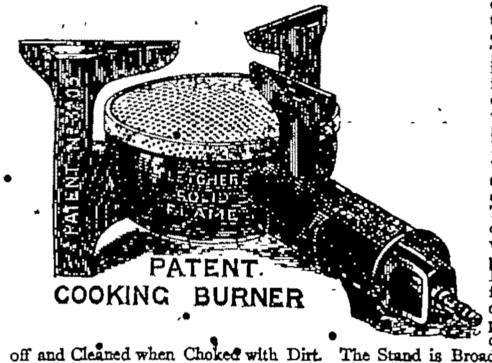
JOHN BROWNING, 63, STRAND, LONDON, W.C.

FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.
[PATENTED AUGUST, 1880.]

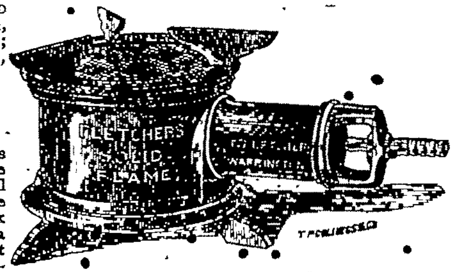
The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work. This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt. The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.

Original Solid Flame Burner, with Gauze, 4s.; or Nickel Plated, 5s.

Two Patterns kept in Stock.



All these Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundred-weight of Lead in an Iron Pot. They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas.

GAS FIRE, an Attachment to the above, making a first-rate Gas Fire, is in preparation.

Complete Illustrated List, Price 3*d.*, of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c.; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

THOS. FLETCHER, 4 & 6, Museum Street, Warrington.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

THE VICTORIA UNIVERSITY.

THE OWENS COLLEGE, MANCHESTER.

A PROSPECTUS containing information on the Course of Instruction, Fees, Scholarships, Exhibitions, &c., may be obtained on application to the Registrar. The Calendar will be published early in September.

J. HOLME NICHOLSON, Registrar *pro tem.*

THE OWENS COLLEGE, MANCHESTER.

The COLLEGE SESSION, 1880–81, will begin in the Medical Department on FRIDAY, the 1st October; in the Arts, Science, and Law Department on TUESDAY, the 5th October; and in the Evening Classes Department on MONDAY, the 11th October.

Candidates for admission must not be under 14 years of age, and in the Arts and Science Department those under 16 will be required to pass a Preliminary Examination in English, Arithmetic, and Elementary Latin.

Prospectuses are published for each of these Departments, and may be obtained on application to the Registrar.

Fuller details respecting the Courses of Instruction, Fees, Scholarships, Exhibitions, &c., will be found in the Calendar, which may be obtained early in September (price 3*s.*, post free 3*s.* 6*d.*) from Mr. CORNISH, 33, Piccadilly, and other Booksellers in Manchester, and from Messrs. MACMILLAN AND CO., London.

The Syllabus of the Evening Classes may now be obtained from Mr. CORNISH (price 6*d.*, post free, 7*d.*).

J. HOLME NICHOLSON, Registrar.

OWENS COLLEGE, MANCHESTER.

A DAUNTESEY MEDICAL ENTRANCE SCHOLARSHIP, value £100, will be offered for Competition, on the 1st OCTOBER, to persons who have not been Students in any Medical School in the United Kingdom, and whose age does not then exceed 25 years. Notice must be given to the Registrar on or before 1st September.

Subjects of Examination:—1. General and Comparative Anatomy. 2. Physiological Botany. 3. Chemistry. 4. Mathematics or Latin.

J. HOLME NICHOLSON, Registrar.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880–1 will commence on October 1, when an Introductory Address will be delivered by W. M. ORD, M.D., Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examination of the University of London. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr. GILLESPIE.

W. M. ORD, M.D., Dean.

UNIVERSITY COLLEGE, LONDON.

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION OF THE UNIVERSITY OF LONDON.

The following Classes meet the requirements of Candidates:—

Chemistry.—Prof. WILLIAMSON, Ph.D., F.R.S.
Experimental Physics.—Prof. G. C. FOSTER, F.R.S.
Zoology.—Prof. LANKESTER, M.A., F.R.S.
Botany and Vegetable Physiology.—Prof. OLIVER, F.R.S., F.L.S.

The Courses of Chemistry, Practical Chemistry, and Botany enter into the ordinary Medical Curriculum, the extra fees amounting to 10 Guineas.

Prospectuses, including information as to Classes for Matriculation, may be obtained from the College, Gower Street, W.C.

TALFOURD ELY, M.A., Secretary.

THE ZOOLOGIST:
A MONTHLY MAGAZINE OF NATURAL HISTORY.
Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts

JOHN VAN VOORST. 1 Paternoster Row.

NORTH BRITISH AGRICULTURIST
is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.
ESTABLISHED 1843.

BRAIN:
A QUARTERLY JOURNAL OF NEUROLOGY.
EDITED BY
J. C. BUCKNILL, M.D., F.R.S., J. CRICHTON-BROWNE, M.D., F.R.S.E., D. FERRIER, M.D., F.R.S., AND J. HUGHLINGS-JACKSON, M.D., F.R.C.P.
Contents.

ORIGINAL ARTICLES:—
- On the Form and Topographical Relations of the Corpus Striatum. By Professor J. C Dalton (New York).
- Nystagmus. By R. P Oglesby.
- On Muscular Spasms known as "Tendon-Reflex." By A. Waller, M.B.
- On Right- or Left-sided Spasm at the Onset of Epileptic Paroxysms, &c. By J Hughlings-Jackson, M.D. F.R.S.
- Notes on Left-handedness. By William W. Ireland, M.D.

CRITICAL DIGESTS AND NOTICES OF BOOKS:—
- Bastian on the Brain as an Organ of Mind By John Charles Bucknill, M.D., F.R.S.
- Lindsay on Mind in the Lower Animals, in Health and Disease. By F. L Benham, M.B.
- Landouzy on Paralysis in Acute Disease By A de Watteville, M.A., B.Sc.
- Mickle on General Paralysis of the Insane. By J. C Bucknill.

CLINICAL CASES:—
- Case of Microcephalic Idiocy. By A R. Urquhart, M.D.
- Case of Cerebral Tumour. By Arthur W. Fox, M.B., and Ernest Field, M.B.

ABSTRACTS OF BRITISH AND FOREIGN JOURNALS:—
- Method of Preserving the Brain (Giacomini) By Allen Thomson, F.R.S.
- Krueg on the Sulci of the Zooplacental Mammalian Brain. By H. Obersteiner
- Féré sur le Développement du Cerveau, &c. Amidon on a New Study of Cerebral Localisation. By A. Waller, M.B.
- Visceral Neurology. By J. Mitchell Bruce, M.D.
- Buzzard on certain Points in Tabes Dorsalis By J. Hughlings-Jackson.
- Abstracts of the Gulstonian Lectures on Epilepsy. By W R. Gowers, M.D.
- On the Disease called Sturdy in Sheep, in its Relation to Cerebral Localisation. By George T. Beatson, B.A., M.D.
- Tripier on Anæsthesia from Cortical Lesions. Sommer on Diseases of the Cornu Ammonis. By D Ferrier

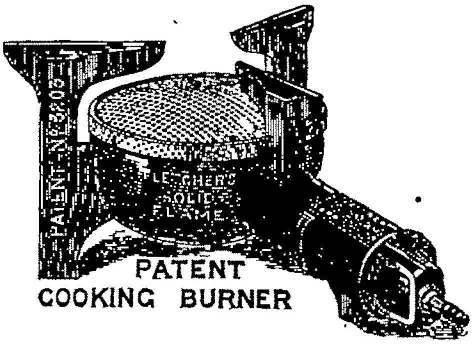
FLETCHER'S

PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.

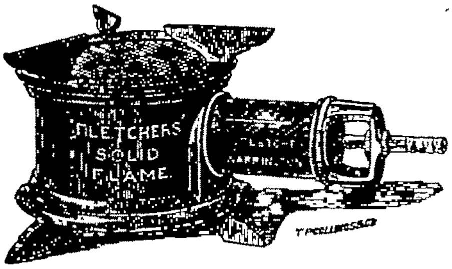
[PATENTED AUGUST, 1880.]

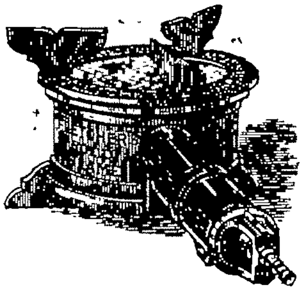
The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work. This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a loose perforated Dome of Solid Copper, which can be taken off and Cleaned when choked with Dirt. The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



PATENT COOKING BURNER

PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.





ORIGINAL SOLID FLAME BURNER, with Gauze, 4s.; or Nickel Plated, 5s.

Two Patterns kept in Stock.

All these Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half-a-hundredweight of Lead in an Iron Pot. They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal Gas.

GAS FIRE.

An Attachment to the above, making a first-rate Gas Fire, is in preparation.

Complete Illustrated List, price 3*d.*, of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c.; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL
AND FARMERS' CHRONICLE
(PRICE 3d. WEEKLY)

The representative organ of the Central and Provincial Chambers of Agriculture, *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:
A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds, occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

On the 1st of every Month, price Sixpence.

THE ENTOMOLOGIST:
AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,
With the Assistance of
FREDERICK BOND, F.Z.S. | JOHN A. POWER, M.D.

J HOLME NICHOLSON, Registrar.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. ORD, M.D., Dean of the School, at 3 p m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examinations of the University of London. All Hospital Appointments are open to Students without charge Scholarships and Prizes to the value of over £300 are awarded at the Sessional Examinations, as also several valuable Silver and Gold Medals. The Fees may be paid in one sum or by instalments, Special Entries may be made to Lectures or to Hospital Practice, and Qualified Practitioners are admitted to Perpetual Attendance for a small Fee Special arrangements are made for Students joining in their 2nd or subsequent years, and also for Dental Students. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr. GILLESPIE. W. M. ORD, M.D., Dean.

BURLINGTON HOUSE,

RICHMOND HILL, SURREY

Mr. A N. FYNES-CLINTON, M.A., late Junior Student of Christ Church, Oxford, Graduate in Classical Honours, and Mr. R. HAWKINS, M.A., late Scholar of Corpus Christi College, Cambridge, Graduate in the Mathematical Tripos, receive Sons of Gentlemen from 8 to 15 years of age to prepare for the Public Schools, &c.

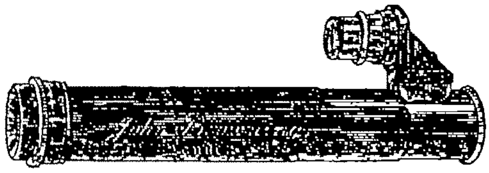
There is a separate class-room for each class, and the bed-rooms are large and lofty. The household arrangements are under the care of Mrs. HAWKINS.

Successes this year include a First Entrance Exhibition at Westminster.

Prospectus and Testimonials will be forwarded on application.

*** *Next Term begins Thursday, September 16th.*

BROWNING'S SPECTROSCOPES.



The New Spectroscope, with Micrometer, may be used for showing any of the leading experiments in Spectrum Analysis; the Fraunhofer lines; the Lines in the Spectra of the Metals, and the Alkaline Earths and Alkalies; the Spectra of Gases; and the Rain-bands. On a Telescope it will show the lines of the Solar Prominences. It can also be used as a Micro-Spectroscope, and the position of the Bands in any Spectrum can be seen with the Micrometer. Price, complete in Case, £3 10*s.*

Illustrated Catalogue of Spectroscopes, Six Stamps.

HOW TO WORK WITH THE SPECTROSCOPE. By JOHN BROWNING. Bound in cloth, 1*s.* 6*d.* post free.

JOHN BROWNING,

63, STRAND, LONDON, W.C.

UNIVERSITY COLLEGE, BRISTOL.

Principal—ALFRED MARSHALL, M.A.

The FIFTH SESSION will begin on OCTOBER 7th, when the New Buildings in Tyndall's Park will be ready for use. The Subjects of Instruction are Chemistry, Mathematics, Physics, Engineering, Surveying, Geometrical and Machine Drawing, Geology, Zoology, Botany, Political Economy, Ancient and Modern Languages, History and Literature. The Chemical Laboratory is open Daily from 10 to 5, and on Tuesday and Thursday Evenings. The Examination for General and Chemical Scholarships begins on September 30th

For prospectus apply to the SECRETARY.

ANDERSON'S COLLEGE, GLASGOW.

Candidates are invited for the CHAIR of NATURAL PHILOSOPHY, vacant by the resignation of Prof. GEORGE FORBES.

Applications to be lodged on or before the 18th current, with the Secretary, who will furnish information regarding the duties and terms of the appointment.

J. B. KIDSTON, Secretary.

50, West Regent Street, Glasgow, 2nd September, 1880.

Rev. W. TUCKWELL, late Head Master of

Taunton College School, and Fellow of New College, Oxford, takes a FEW BOYS AS PUPILS. Preparation for the Civil Service and the Oxford and Cambridge Certificate.—Address, Stockton Rectory, near Rugby.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

ROYAL SCHOOL OF MINES.

DEPARTMENT OF SCIENCE AND ART.

During the Thirtieth Session, 1880–81, which will commence on the 1st of OCTOBER, the following COURSES of LECTURES and PRACTICAL DEMONSTRATIONS will be given:—

1. Chemistry By E. Frankland, Ph.D., D.C.L., F.R.S.
2. Biology. By T. H. Huxley, LL.D., F.R.S.
3. Mineralogy. } By Warington W. Smyth, M.A., F.R.S.,
4. Mining. } Chairman.
5. Geology. By John W. Judd, F.R.S.
6. Applied Mechanics. By T. M. Goodeve, M.A.
7. Physics. By Frederick Guthrie.
8. Metallurgy. By W. Chandler Roberts, F.R.S.
9. Mechanical Drawing. By Rev. J. H. Edgar, M.A.

The Lecture Fees for Students desirous of becoming Associates are £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories.

Tickets to separate Courses of Lectures are issued at £3 and £4 each.

Officers in the Queen's Service, Her Majesty's Consuls, Acting Mining Agents and Managers may obtain Tickets at reduced prices.

Science Teachers are also admitted to the Lectures at reduced fees.

For particulars (free) or for Official Prospectus (price 6*d*., by post 7*d*.), apply to the Registrar, Royal School of Mines, Jermyn Street, London, S.W.

F. W. RUDLER, Registrar.

ST. THOMAS'S HOSPITAL,

ALBERT EMBANKMENT, S.E., MEDICAL SCHOOL.

Two Entrance Scholarships in Natural Science, value £100 and £60 respectively, will be awarded after an Examination, which will be held on October 4th, 5th, and 6th. The Subjects of the Examination will be Chemistry and Physics, with either Botany or Zoology at the option of Candidates. The Examination will be open to all 1st year Students without the Condition of their having first joined as Students of the Hospital.

Full Particulars may be obtained on Application to the Secretary, Dr. GILLESPIE.

W. M. ORD, M.D., Dean.

UNIVERSITY COLLEGE, LONDON.

The SESSION of the FACULTY of MEDICINE will begin on MONDAY, October 4th.

The Examinations for the Entrance Exhibitions will be held on the 28th and 29th of September.

The School for Boys will reopen on September 21st.

The College is close to the Gower Street Station of the Metropolitan Railway.

TALFOURD ELY, M.A., Secretary.

1st B.Sc. & PRELIMINARY SCIENTIFIC M.B., LONDON UNIVERSITY.

At the late Examination, 16 Pupils of EDWARD B. AVELING, D.Sc., presented themselves for examination; of these, 13 passed. Classes for the Examinations in 1881 commence the First Week in October. All the work practical. Every subject taught. Examination Papers given and corrected every week. All animals, plants, reagents, apparatus, microscopes provided. Fee for the Nine Months' Course, £15 15*s*. (payable in advance). The advisability of commencing in October, and not waiting until January, is strongly urged upon all Students. Communicate with Dr. EDWARD B. AVELING, Royal Polytechnic, Regent Street, London.

MATRICULATION AT LONDON UNIVERSITY.

A Class for the study of all the subjects commences September 20th. Fee, £10 10*s* (payable in advance) Address as above.

The POST of ATTENDANT at the Cavendish Physical Laboratory, Cambridge, is now VACANT. Applicants must be of good character, intelligent, and experienced in handling apparatus. Moderate skill in glass-blowing desirable. Stipend, £80 per annum, with house and an allowance of coals.—Apply, stating age and qualifications, to Lord RAYLEIGH, 5, Salisbury Villas, Cambridge.

A DEAF GENTLEMAN desires a SITUATION under an Electrician, Botanist, or other Scientific Man.—Address SCHOLARIS, care of Publishers of NATURE, 29, Bedford Street, Strand, London.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, MICROSCOPIST'S and NATURALIST'S STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B has last week sent to his subscribers *Daphnia pulex*, with drawing and description. He has also sent out *Lucernaria auricula*, *Cristatella mucedo*, *Paludicella Ehrenbergi*, *Leptodora hyalina*, *Stentor volvox*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in Course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. H.R.H. The Duke of Cambridge is expected to preside on the occasion. The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital.

ANDREW CLARK, Dean.

CITY and GUILDS of LONDON INSTITUTE for the ADVANCEMENT of TECHNICAL EDUCATION. —Wanted an Assistant accustomed to Physical Laboratory Work, and especially with a Practical Knowledge of Electrical Measurements. For Terms, &c., apply, by Letter, to Prof. AYRTON, Technical School, Cowper Street, Finsbury, E.C.

PROFESSOR TENNANT'S LECTURES on MINERALOGY, applied to GEOLOGY and the ARTS, at King's College. Two Courses are given: one on Saturday Mornings from 10.20 to 11.20, and the other on Thursday Evenings from 8 to 9. The Public are admitted on paying the College fees. The Lectures begin SATURDAY, 9th of October, and terminate at Easter. They are illustrated by a large series of Specimens, chiefly from his Private Collection. Persons unable to attend Public Lectures can have *Private Instruction* in *Mineralogy* and *Geology* of Prof. TENNANT at his residence, 149, Strand, W.C. Terms, 7*s*. for Lesson of One Hour.

FOSSILS AND IMPLEMENTS.

MR. BRAUN, lately arrived from America, wishes to inform Principals of Museums, Colleges, Schools, Societies, and the Public in general, that he has now on Exhibition and for Sale at 8, Silver Street (Bury Place), near British Museum, until 10th September, a Collection of magnificent preserved Fossils, Crinoids and others, representing the Silurian, Devonian, Carboniferous, Cretaceous, and Tertiary formations, exclusively of America.

Also a very fine Collection of Indian and Mound Builders' Relics of North American origin.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS OF THE NEW MINERAL
ONTARIOLITE; METEORIC STONE, Waconda;
METEORIC IRON, Estherville;
VERY BRILLIANT CRYSTALS OF RUTILE, America;
CRYSTALLISED EUXENITE, Norway;
CRYSTALS OF EMERALD, Mexico;
FINE POLISHED SLABS OF MICROLINE AND LABRADORITE.

COLLECTIONS FOR STUDENTS, from £2 2*s*.
COLLECTIONS FOR BEGINNERS, from 4*s*.
BLOWPIPE CASES AND APPARATUS.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

Now publishing, in Crown 8vo. Price 2s 6d. each.

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 100,000 Vols. of this series have been sold.

BYRON. By PROF. JOHN NICHOL. Cr. 8vo. 2s. 6d.

POPE. By LESLIE STEPHEN. Crown 8vo. 2s. 6d.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH. Crown 8vo. 2s. 6d.

CHAUCER. By Prof. A. W. WARD. Crown 8vo. 2s. 6d.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE. Crown 8vo. 2s. 6d.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN. Crown 8vo. 2s. 6d.

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES. Crown 8vo. 2s. 6d.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON. Crown 8vo. 2s 6d.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN. Crown 8vo. 2s. 6d.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON. Crown 8vo. 2s. 6d.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON. Crown 8vo. 2s. 6d.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS. Crown 8vo. 2s. 6d.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S. Crown 8vo. 2s. 6d.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK. Crown 8vo. 2s. 6d.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. MINTO. Crown 8vo. 2s. 6d.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal SHAIRP. Crown 8vo. 2s. 6d.

"It is impossible to desire fairer criticisms than Principal Shairp's on Burns's poetry. . . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S. Crown 8vo. 2s. 6d.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE. Crown 8vo. 2s. 6d.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY. Crown 8vo. 2s. 6d.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

Others in Preparation.

MACMILLAN AND CO., LONDON.

KIRKES' PHYSIOLOGY.

On OCTOBER 10th.

Tenth Edition, Revised, with 420 Illustrations, post 8vo, 14s.

KIRKES' HANDBOOK of PHYSIOLOGY.

By W. MORRANT BAKER, F.R.C.S., Lecturer on Physiology and Assistant-Surgeon to St. Bartholomew's Hospital, and Surgeon to the Evelina Hospital for Sick Children.

The Chapter on the Chemical Composition of the Human Body has been in great part re-written, and the text has been much altered in many others, especially the Chapters on the Blood, Circulation, Respiration, Digestion, and the Nervous System.

About 60 new Illustrations have been added.

JOHN MURRAY, Albemarle Street.

PROF. HEER'S PRIMEVAL WORLD of

SWITZERLAND, with Geological Map and 560 Illustrations, edited by JAMES HEYWOOD, M.A., F.R.S. In 2 vols., 8vo. Price 16s.

London: LONGMANS & CO

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

Now ready, post quarto, cloth gilt, 272 pages. Price 16s.

LIGHTNING CONDUCTORS:

THEIR

HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,

Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.

With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum.*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street. 1880.

PRICE ONE SHILLING—SECOND EDITION—

PHOTOGRAPHIC PRINTER'S ASSISTANT:

A MANUAL OF SILVER-PRINTING.

By WILLIAM HEIGHWAY.

"We can cordially commend the little work as trustworthy and excellent."—*Photo News.*

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 568, Vol. 22] THURSDAY, SEPTEMBER 16, 1880 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

UNIVERSITY COLLEGE, LONDON.

DEPARTMENT OF APPLIED SCIENCE AND TECHNOLOGY.

Engineering and Mechanical Technology.—Prof Alex. B. W. Kennedy, M. Inst. C.E., M. Inst. M.E.

Chemical Technology.—Prof. Charles Graham, D.Sc., F.I C.

LECTURES commence October 6th, and Practical Work in Engineering and Chemical Laboratories at the same date.

Prospectuses may be obtained from the College, Gower Street, W.C.

TALFOURD ELY, M A., Secretary.

KING'S COLLEGE, LONDON.

EVENING CLASSES IN EXPERIMENTAL PHYSICS.

These Classes, which will commence on the 13th of OCTOBER, are under the management of R. E. Day, M.A., Author of "Exercises in Electrical Measurement," "Examples in Heat," &c.

The Course for 1880–81 will treat of Heat and Statical Electricity.

For further particulars apply to

J. W. CUNNINGHAM, Secretary.

THE OWENS COLLEGE, MANCHESTER.

The COLLEGE SESSION, 1880–81, will begin in the Medical Department on FRIDAY, the 1st October; in the Arts, Science, and Law Department on TUESDAY, the 5th October; and in the Evening Classes Department on MONDAY, the 11th October.

Candidates for admission must not be under 14 years of age, and in the Arts and Science Department those under 16 will be required to pass a Preliminary Examination in English, Arithmetic, and Elementary Latin.

Prospectuses are published for each of these Departments, and may be obtained on application to the Registrar.

Fuller details respecting the Courses of Instruction, Fees, Scholarships, Exhibitions, &c., will be found in the Calendar, which may be obtained early in September (price 3*s.*, post free 3*s.* 6*d.*) from Mr. Cornish, 33, Piccadilly, and other Booksellers in Manchester, and from Messrs. Macmillan and Co., London.

The Syllabus of the Evening Classes may now be obtained from Mr. Cornish (price 6*d.*, post free, 7*d.*).

J. HOLME NICHOLSON, Registrar.

THE VICTORIA UNIVERSITY.

THE OWENS COLLEGE, MANCHESTER.

A PROSPECTUS containing information on the Course of Instruction, Fees, Scholarships, Exhibitions, &c., may be obtained on application to the Registrar. The Calendar will be published early in September.

J HOLME NICHOLSON, Registrar *pro tem.*

QUEEN'S COLLEGES, IRELAND.

The PROFESSORSHIP of SURGERY in the Queen's College, Cork, being about to become VACANT, Candidates for that Office are requested to forward their Testimonials to the Under-Secretary, Dublin Castle, on or before the 30th SEPTEMBER, 1880, in order that the same may be submitted to his Excellency, The Lord Lieutenant.

The Candidate who may be selected for the above Professorship will have to enter upon his duties forthwith.

Dublin Castle, 7th September, 1880.

ANDERSON'S COLLEGE, GLASGOW.

Candidates are invited for the CHAIR of NATURAL PHILOSOPHY, vacant by the resignation of Prof. George Forbes.

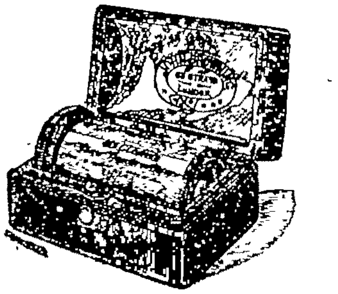
Applications to be lodged on or before the 18th current, with the Secretary, who will furnish information regarding the duties and terms of the appointment.

J. B KIDSTON, Secretary.

50, West Regent Street, Glasgow, 2nd September, 1880.

McCLEAN'S STAR SPECTROSCOPE.

(PATENT.)



Mr. Browning begs to call the attention of scientific gentlemen to McClean's Star Spectroscope, which is by far the most efficient Star Spectroscope yet contrived. It is simply an eyepiece which can be used with *any* telescope. Being without a slit, there is no difficulty in keeping the spectrum of a star under observation constantly in the field of view, and the spectra are of great brilliancy. Price of the Star Spectroscope in case, £2 10*s.*

List of Prices of Spectroscopes Free.

Illustrated Catalogue, Sixpence.

JOHN BROWNING, 63, STRAND, LONDON, W.C.

ROYAL SCHOOL OF MINES.

DEPARTMENT OF SCIENCE AND ART

During the Thirtieth Session, 1880–81, which will commence on the 1st of OCTOBER, the following COURSES of LECTURES and PRACTICAL DEMONSTRATIONS will be given —

1. Chemistry By E. Frankland, Ph.D., D.C L., F.R.S.
2. Biology. By T. H Huxley, LL D., F.R S
3. Mineralogy. } By Warington W. Smyth, M.A , F.R.S , Chairman.
4. Mining. }
5. Geology By John W Judd, F R.S.
6. Applied Mechanics By T. M. Goodeve, M A
7. Physics. By Frederick Guthrie.
8. Metallurgy. By W. Chandler Roberts, F.R S.
9. Mechanical Drawing. By Rev. J. H Edgar, M.A.

The Lecture Fees for Students desirous of becoming Associates are £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories.

Tickets to separate Courses of Lectures are issued at £3 and £4 each.

Officers in the Queen's Service, Her Majesty's Consuls, Acting Mining Agents and Managers may obtain Tickets at reduced prices.

Science Teachers are also admitted to the Lectures at reduced fees.

For particulars (free) or for Official Prospectus (price 6*d.*, by post 7*d.*), apply to the Registrar, Royal School of Mines, Jermyn Street, London, S.W.

F. W. RUDLER, Registrar.

FOR SALE.—First Twelve Volumes of Nature, Uniform, £2 10*s.* Carriage paid.—Address J. H. Chamberlin, Berry Brow, near Huddersfield.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M ORD, M.D, Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M B Examinations of the University of London All Hospital Appointments are open to Students without charge. Scholarships and Prizes to the value of over £300 are awarded at the Sessional Examinations, as also several valuable Silver and Gold Medals. The Fees may be paid in one sum or by instalments, Special Entries may be made to Lectures or to Hospital Practice, and Qualified Practitioners are admitted to Perpetual Attendance for a small Fee. Special arrangements are made for Students joining in their 2nd or subsequent years, and also for Dental Students. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr GILLESPIE. W. M ORD, M D., Dean.

ST. THOMAS'S HOSPITAL,

ALBERT EMBANKMENT, S.E., MEDICAL SCHOOL.

Two Entrance Scholarships in Natural Science, value £100 and £60 respectively, will be awarded after an Examination, which will be held on October 4th, 5th, and 6th The Subjects of the Examination will be Chemistry and Physics, with either Botany or Zoology at the option of Candidates The Examination will be open to all 1st year Students without the Condition of their having first joined as Students of the Hospital.

Full Particulars may be obtained on Application to the Secretary, Dr. GILLESPIE. W. M ORD, M D., Dean.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. H.R.H. The Duke of Cambridge is expected to preside on the occasion The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital. ANDREW CLARK, Dean.

GUY'S HOSPITAL MEDICAL SCHOOL.

OPEN SCHOLARSHIPS

A SCHOLARSHIP of the value of 125 Guineas will be offered for OPEN COMPETITION on FRIDAY, September 24th. Subjects of Examination—Classics, Mathematics, and Modern Languages.

A Second SCHOLARSHIP, also of the value of 125 Guineas, will be offered for Open Competition on the same day. Subjects of Examination—Inorganic Chemistry, Physics, Botany, and Zoology.

For further particulars apply to the DEAN, Guy's Hospital, S.E.

CITY AND GUILDS OF LONDON INSTITUTE.

TECHNOLOGICAL EXAMINATIONS.

The next Examinations in Technology will be held at the different Science Centres throughout the Kingdom on two evenings in MAY, 1881.

Teachers desiring to form Classes should apply AT ONCE to the Director and Secretary of the Institute.

List of subjects in which the Examination will be held, and general conditions of payment on results, can be obtained by application to the Central Office, Gresham College, London, E.C

PHILIP MAGNUS, Director and Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AGRICULTURAL EDUCATION.

The Examination of Candidates for the Society's Junior Scholarships, value £20 each, will take place in November next.

Copies of the Regulations may be had on application to

H. M. JENKINS, Secretary.

12, Hanover Square, London, W.

BURLINGTON HOUSE,

RICHMOND HILL, SURREY.

Mr A N FYNES-CLINTON, M.A., late Junior Student of Christ Church, Oxford, Graduate in Classical Honours, and Mr R HAWKINS, M.A., late Scholar of Corpus Christi College, Cambridge, Graduate in the Mathematical Tripos, receive Sons of Gentlemen from 8 to 15 years of age to prepare for the Public Schools, &c.

There is a separate class-room for each class, and the bed-rooms are large and lofty. The household arrangements are under the care of Mrs. HAWKINS

Successes this year include a First Entrance Exhibition at Westminster

Prospectus and Testimonials will be forwarded on application.

⁂ Next Term begins Thursday, September 16th

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 17, ANN STREET, BIRMINGHAM.

T B. has last week sent out to his subscribers the Marine Polyzoa, *Bugula turbinata* (known as the Corkscrew and Bird's-head Coralline), with sketch and description. He has also sent out four other Species of Marine Polyzoa, besides several Crustacea, Annelida, and Infusoria, as well as *Lacinularia socialis, Stephanoceros Eichhornii, Alcyonella fungosa,* &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be opened on the 1st of October next, with an INTRODUCTORY LECTURE, by Dr. T. H. HUXLEY, F R.S.

The CLASSES for STUDENTS will COMMENCE on Tuesday, the 5th of October.

The COURSE of INSTRUCTION, as at present arranged, includes—

MATHEMATICS ... ... Professor M. J. M. HILL, M.A.
CHEMISTRY ... ... Professor W. A. TILDEN, D Sc Lond., F R S.
PHYSICS ... ... Professor J. H. POYNTING, M A., B.Sc. Lond.
BIOLOGY... ... ... Professor T. W. BRIDGE, M.A., F.Z.S.

The course is designed to prepare students for the degrees of B Sc. and D Sc. of the University of London.

Information as to the terms of admission, and the arrangement of classes, may be obtained on application to Mr S. Allport, Curator, at the College, Edmund Street, Birmingham. The Professors attend daily (except Saturday) at the College, and will be glad to confer with intending Students.

A List of Lodgings suitable for Students may be obtained at the College.

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, May 26, 1880.

The POST of ATTENDANT at the Cavendish Physical Laboratory, Cambridge, is now VACANT.

Applicants must be of good character, intelligent, and experienced in handling apparatus. Moderate skill in glass-blowing desirable Stipend, £80 per annum, with house and an allowance of coals.—Apply, stating age and qualifications, to Lord RAYLEIGH, 5, Salisbury Villas, Cambridge.

A TEXT-BOOK OF THE

PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY;

INCLUDING

AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE.

BY ARTHUR GAMGEE, M.D., F.R.S.,

Professor of Physiology in Owens College, Manchester.

LONDON: MACMILLAN AND CO.

This work, of which the first volume is now published, and of which the second and concluding volume will be published in 1881, aims at giving a more complete account of the present state of physiological and pathological chemistry than is to be found in any of the existing text-books. The special features of the work are the following:—

First.—Physiological Chemistry is treated of from the points of view of the physiologist and physician rather than from that of the pure chemist, although no chemical fact and even no chemical speculation is omitted which appears to throw any light upon a biological question. The classification adopted is, however, based upon physiological and pathological rather than chemical considerations.

Secondly.—It has been sought to combine a thoroughly systematic treatment of each subject with a full description of those method of research which have in the past proved of the greatest value to the investigator. In the pursuit of this aim, detailed accounts are given of methods which have, in many cases, hitherto been only incidentally referred to by the systematic writer. It seemed the most important to do this in a work intended for the scientific worker, anxious not merely to learn what had been already acquired to science, but wishful himself to extend the boundaries. Methods of analysis are described with great care, so as to render the work a trustworthy laboratary guide for the student of physiological chemistry and the practical physician.

Thirdly.—The history of each subject treated of is dwelt upon with great thoroughness, a detailed account of all epoch-making researches being given, and the full titles of nearly all papers quoted being given.

Fourthly.—The work is copiously illustrated, the illustrations being in many cases original.

Fifthly.—Whereas in the first volume the chemical composition of and the chemical processes connected with the elementary tissues of the organism are mainly dwelt upon, the second volume will deal with the chemical history of the complex animal processes.

To be completed in Six Monthly Parts, price 10s. 6d. each.

Subscribers ordering and paying before October 1st will be supplied with the Six Parts as issued for £2 8s.

PART I. WILL BE READY ON OCTOBER 1.

A MANUAL OF THE INFUSORIA:

INCLUDING A DESCRIPTION OF ALL KNOWN

FLAGELLATE, CILIATE, AND TENTACULIFEROUS PROTOZOA,

BRITISH AND FOREIGN,

AND AN ACCOUNT OF THE ORGANISATION AND AFFINITIES OF THE SPONGES.

BY W. SAVILLE KENT, F.L.S., F.Z.S., F.R.M.S.

This important work, the result of many years' careful labour and investigation on the part of the author, will, it is hoped, meet a want which has long existed among microscopists. It will consist of a volume of text extending to about 800 pages super royal 8vo, and an atlas of 48 plates containing upwards of 2,000 figures.

London: DAVID BOGUE, 3, St. Martin's Place, W.C.

Demy 4to, Cloth, with 18 Plates, price £2 2s.

AURORÆ: their Characters and Spectra.

SWITZERLAND, with Geological Map and 560 Illustrations, edited by JAMES HEYWOOD, M.A., F.R.S. In 2 vols., 8vo. Price 16s.

London: LONGMANS & CO.

KIRKES' PHYSIOLOGY.

On OCTOBER 10th.

Tenth Edition, Revised, with 420 Illustrations, post 8vo, 14s.

KIRKES' HANDBOOK of PHYSIOLOGY.

By W. MORRANT BAKER, F.R.C.S., Lecturer on Physiology and Assistant-Surgeon to St Bartholomew's Hospital, and Surgeon to the Evelina Hospital for Sick Children.

The Chapter on the Chemical Composition of the Human Body has been in great part re-written; and the text has been much altered in many others, especially the Chapters on the Blood, Circulation, Respiration, Digestion, and the Nervous System.

About 60 new Illustrations have been added.

JOHN MURRAY, Albemarle Street.

In fcap. 8vo, price 3s. 6d.

SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

MACMILLAN & CO., LONDON.

COLLECTION OF MINERALS.

MR. BRYCE-WRIGHT has for Sale one of the finest Collections of Minerals ever offered to the public. It consists of about 5,000 Specimens, each being a marvel of crystallisation, and includes nearly every rare species known. It has occupied in its formation the undivided attention of a gentleman for fifteen years. Size, 1½ to 2 inches square. For further particulars and to view apply to

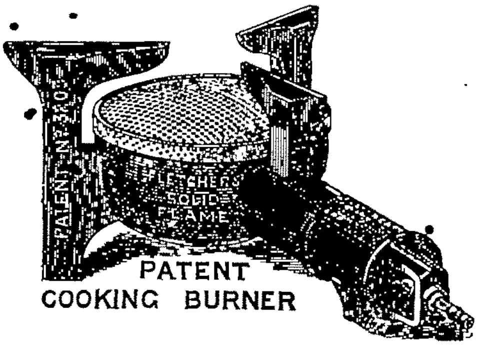
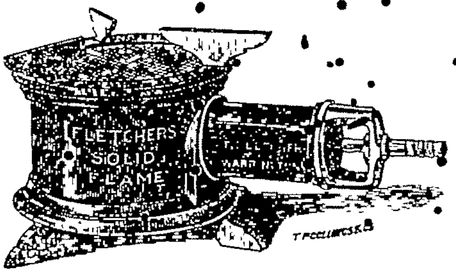
FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.
[PATENTED AUGUST, 1880.]

The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily

PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.





ORIGINAL SOLID FLAME BURNER, with Gauze, 4s.; or Nickel Plated, 5s

Two Patterns kept in Stock.

All these Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas

GAS FIRE, an Attachment to the above, making a first-rate Gas Fire, is in preparation.

Complete Illustrated List, Price 3d., of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c.; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 569, Vol. 22] THURSDAY, SEPTEMBER 23, 1880 [Price Sixpence

Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

KING'S COLLEGE, LONDON.

EVENING CLASSES IN EXPERIMENTAL PHYSICS.

These Classes, which will commence on the 13th of OCTOBER, are under the management of R. E. Day, M A., Author of "Exercises in Electrical Measurement," "Examples in Heat," &c

The Course for 1880–81 will treat of Heat and Statical Electricity.

For further particulars apply to ' J. W. CUNNINGHAM, Secretary.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W M. Ord, M.D, Dean of the School, at 3 p m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M B. Examinations of the University of London. All Hospital Appointments are open to Students without charge. Scholarships and Prizes to the value of over £300 are awarded at the Sessional Examinations, as also several valuable Silver and Gold Medals. The Fees may be paid in one sum or by instalments, Special Entries may be made to Lectures or to Hospital Practice, and Qualified Practitioners are admitted to Perpetual Attendance for a small Fee. Special arrangements are made for Students joining in their 2nd or subsequent years, and also for Dental Students. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr Gillespie. W. M ORD, M.D., Dean.

ST. THOMAS'S HOSPITAL,

ALBERT EMBANKMENT, S.E, MEDICAL SCHOOL.

Two Entrance Scholarships in Natural Science, value £100 and £60 respectively, will be awarded after an Examination, which will be held on October 4th, 5th, and 6th The Subjects of the Examination will be Chemistry and Physics, with either Botany or Zoology at the option of Candidates The Examination will be open to all 1st year Students without the Condition of their having first joined as Students of the Hospital.

Full Particulars may be obtained on Application to the Secretary, Dr. Gillespie. W M. ORD, M D., Dean.

ROYAL SCHOOL OF MINES.

DEPARTMENT OF SCIENCE AND ART.

During the Thirtieth Session, 1880–81, which will commence on the 1st of OCTOBER, the following COURSES of LECTURES and PRACTICAL DEMONSTRATIONS will be given:—

1. Chemistry. By E. Frankland, Ph D., D C.L., F.R.S.
2. Biology. By T. H. Huxley, LL.D, F.R.S.
3. Mineralogy. } By Warington W. Smyth, M.A., F.R.S., Chairman.
4. Mining. }
5. Geology By John W. Judd, F.R.S.
6. Applied Mechanics. By T M. Goodeve, M.A.
7. Physics. By Frederick Guthrie.
8. Metallurgy. By W. Chandler Roberts, F.R.S.
9. Mechanical Drawing. By Rev. J. H. Edgar, M.A.

The Lecture Fees for Students desirous of becoming Associates are £30 in one sum, on entrance, or two annual payments of £20, exclusive of the Laboratories.

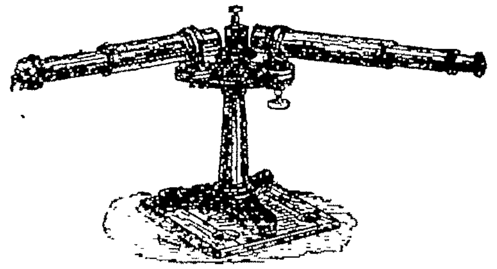
Tickets to separate Courses of Lectures are issued at £3 and £4 each.

Officers in the Queen's Service, Her Majesty's Consuls, Acting Mining Agents and Managers may obtain Tickets at reduced prices.

Science Teachers are also admitted to the Lectures at reduced fees.

For particulars (free) or for Official Prospectus (price 6*d.*, by post 7*d.*), apply to the Registrar, Royal School of Mines, Jermyn Street, London, S.W. F. W. RUDLER, Registrar.

BROWNING'S SPECTROSCOPES.



The Student's Spectroscope has a prism of extremely dense glass, of very superior workmanship; the circle is divided, and reads with a vernier to single minutes; the slit is furnished with a reflecting prism, by means of which two spectra can be shown in the field of view at the same time. The instrument will divide the D line in the Solar Spectrum, or the yellow Sodium lines distinctly. With a slight alteration of the adjustments, the instrument can be used for taking the refractive and dispersive powers of solids or liquids.

PRICE, COMPLETE IN CABINET, £6 10s. 0d.

Illustrated Catalogue of Spectroscopes, Price Sixpence.

JOHN BROWNING, 63, STRAND, LONDON, W.C.

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be OPENED on the 1st of October next, with an INTRODUCTORY LECTURE, by Dr T. H. HUXLEY, F.R.S.

The CLASSES for STUDENTS will COMMENCE on Tuesday, the 5th of October.

The COURSE of INSTRUCTION, as at present arranged, includes—

Mathematics	Professor M. J. M. HILL, M.A.
Chemistry	Professor W. A. TILDEN, D.Sc. Lond., F.R S.
Physics	Professor J. H. POYNTING, M A, B.Sc. Lond
Biology...	Professor T W. BRIDGE, M.A., F.Z.S.

The course is designed to prepare students for any pursuit in which a practical knowledge of science may be necessary or desirable. The instruction will also be of such a character as will enable students to pass the requisite examinations for the degrees of B.Sc. and D.Sc. of the University of London.

Information as to the terms of admission, and the arrangement of classes, may be obtained on application to Mr. S. Allport, Curator, at the College, Edmund Street, Birmingham. The Professors attend daily at 11 to 12 o'clock at the College, and will be glad to confer with intending Students.

All Departments of the College are Open to Both Sexes on the same terms.

A List of Lodgings suitable for Students may be obtained at the College.

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, September 16, 1880.

MATRICULATION OF THE UNIVERSITY OF LONDON, JANUARY, 1881.

A CLASS in all the Subjects of this Examination will be held at Guy's Hospital, commencing MONDAY, October 11th. The Class is not confined to Students of the Hospital.

For particulars apply to the Dean, Guy's Hospital, London, S.E.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

UNIVERSITY COLLEGE, BRISTOL.

The next Session will begin on OCTOBER 7th, 1880 The College supplies for persons of either sex, above the ordinary school age, the means of continuing their studies in Science, Languages, History, and Literature. The Chemical Laboratory is open daily from ten to five. Arrangements have been made by which Students in the Engineering Department can spend the six summer months as Pupils with various Engineering Firms in and near Bristol. Information with regard to the lodging of Students will be given by the Principal, on application through the Secretary.

For Prospectus and further information apply to

EDWARD STOCK, M.R.C.S, Secretary.

Midwifery and Diseases of Women and Children.—John Thorburn, M D.
Materia Medica and Therapeutics. { Alexander Somers, M.R.C S. / Daniel John Leech, M D.
Hygiene and Public Health.—Arthur Ransome, M D., M A.
Medical Jurisprudence.—Charles J. Cullingworth, M R C.P. & S.
Practical Morbid Histology.—Julius Dreschfeld, M.D.
Ophthalmology.—David Little, M D.
Practical Chemistry.—Henry E. Roscoe, LL.D., F.R.S.
Botany.—W. C. Williamson, F R.S.

Demonstrators in Anatomy. { Alexander Fraser, M.B. / J. Macdonald Brown, M.B.
Demonstrator and Assistant Lecturer in Biology.—Marcus M. Hartog, M.A, B Sc.

The Lectures in Anatomy, Physiology, and Chemistry are recognised by the University of Edinburgh, and attendance upon any two of these Courses for Six Months will count as one of the Winter Sessions required by the University for the M.B degree

The next Session will commence on the 1st OCTOBER.

Prospectuses may be obtained from Mr. Cornish and other Booksellers in Manchester, and by application to the Registrar.

J. HOLME NICHOLSON, Registrar.

FIRTH COLLEGE, SHEFFIELD.

SESSION 1880–81.

Day Lectures and Classes begin on WEDNESDAY, October 6th.

Evening Lectures and Classes on MONDAY, October 11th.

There is a good Chemical Laboratory, with fittings and appliances of the most approved kind.

In addition to the regular College Classes there will be a Course of Lectures on Biology, by Rev. W. H. Dallinger, F R S.

Prospectus with full particulars on application to the Registrar.

THE OWENS COLLEGE, MANCHESTER.

The COLLEGE SESSION, 1880–81, will begin in the Medical Department on FRIDAY, the 1st October; in the Arts, Science, and Law Department on TUESDAY, the 5th October, and in the Evening Classes Department on MONDAY, the 11th October.

Candidates for admission must not be under 14 years of age, and in the Arts and Science Department those under 16 will be required to pass a Preliminary Examination in English, Arithmetic, and Elementary Latin.

Prospectuses are published for each of these Departments, and may be obtained on application to the Registrar.

Fuller details respecting the Courses of Instruction, Fees, Scholarships, Exhibitions, &c., will be found in the Calendar, which may be obtained early in September (price 3s, post free 3s. 6d.) from Mr. Cornish, 33, Piccadilly, and other Booksellers in Manchester, and from Messrs. Macmillan and Co., London.

The Syllabus of the Evening Classes may now be obtained from Mr. Cornish (price 6d., post free, 7d.).

J. HOLME NICHOLSON, Registrar.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers specimens of the Infusorian, *Nassula ornata*, with drawing and description. He has also sent out *Pedicellina cernua, Lacinularia socialis, Spongilla fluviatilis, Alcyonella fungosa, Fredericella sultana*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1 1s.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 3, One Shilling.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. H R.H. The Duke of Cambridge is expected to preside on the occasion The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital. ANDREW CLARK, Dean.

Rev. W. TUCKWELL, late Head Master of

Taunton College School, and Fellow of New College, Oxford, takes a FEW BOYS AS PUPILS. Preparation for the Civil Service and the Oxford and Cambridge Certificate.—Address, Stockton Rectory, near Rugby.

THE VICTORIA UNIVERSITY.

THE OWENS COLLEGE, MANCHESTER.

A PROSPECTUS containing information on the Course of Instruction, Fees, Scholarships, Exhibitions, &c., may be obtained on application to the Registrar. The Calendar will be published early in September.

J. HOLME NICHOLSON, Registrar *pro tem.*

EVENING SCIENCE LECTURES.—Mr.

W. J. WILSON, F C.S., M.S T.E (Demonstrator of Practical Physics at South Kensington), will commence a Course of about Sixty Lectures on Electricity, Magnetism, Light, Heat, and Sound, in the Theatre of the Birkbeck Institution, Southampton Buildings, W.C, on FRIDAY, October 8th, at 8 o'clock, to be continued on succeeding Fridays, at the same hour, and terminating with the Government Examinations in May. Fee for the Course, 8s. For detailed syllabus, particulars of special prizes, &c., apply to the Librarian.

PHOTOGRAPHY.

A Course of Instruction in Theoretical and Practical Photography by Mr. JOHN M. THOMSON, F R.S.E, in connection with the King's College Applied Science Department, will commence in OCTOBER, and be continued during the Session on Mondays, from 11.15 to 1 15. Extra Instruction will also be given by special arrangement.

CHEMISTRY.

A Course of Lectures on Inorganic and Organic Chemistry will be given by Mr. JOHN M. THOMSON, F.R S E, in connection with the King's College Evening Class Department, from OCTOBER till EASTER, on Mondays and Thursdays, from 7 to 8 p.m. A Class in Practical Chemistry will also be held on Tuesdays, from 7 to 9 p.m.

For particulars apply to the Secretary, King's College, Strand, W C.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D Sc., F.L.S. London University Matriculation, 1st and 2nd B Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

THE YORKSHIRE COLLEGE.

The SEVENTH SESSION opens October 5th, 1880

DAY CLASSES in Mathematics, Experimental Physics (Lectures and Laboratory), Chemistry (Lectures and Laboratory), Geology and Mining (Lectures, Practical Classes, and Excursions), Coal Mining, General Biology, Zoology and Comparative Anatomy, Botany, Civil and Mechanical Engineering, Geometrical and Mechanical Drawing, Classics, Ancient and Modern History, English, Language and Literature, Mental and Moral Science, French, German, Oriental Languages, Textile Industries and Dyeing.

LECTURES AND CLASSES FOR OCCASIONAL STUDENTS in Mathematics, Chemistry, Geology, Practical Physiology, Ancient and English Literature, English History, French and German Literature, and Textile Industries.

EVENING LECTURES AND CLASSES in Mathematics, Chemistry, Geology, Zoology, Botany, Engineering, Latin, Greek, Roman History, Political Economy, French, and Textile Industries.

Calendar now ready (1s, by post 1s. 4d.) Prospectus free on application to the Secretary, Cockridge Street, Leeds.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS OF THE NEW MINERAL
ONTARIOLITE, METEORIC STONE, Waconda;
METEORIC IRON, Estherville;
VERY BRILLIANT CRYSTALS OF RUTILE, America;
CRYSTALLISED EUXENITE, Norway;
CRYSTALS OF EMERALD, Mexico;
FINE POLISHED SLABS OF MICROLINE AND LABRADORITE.
COLLECTIONS FOR STUDENTS, from £2 2s
COLLECTIONS FOR BEGINNERS, from 4s.
BLOWPIPE CASES AND APPARATUS.
PRIVATE LESSONS AND EVENING CLASSES.
Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.
Mr. HENSON'S usual Course of EVENING LECTURES will commence First Week in OCTOBER.

50 ROCKS, 50 FOSSILS. 50 MINERALS,
NEATLY ARRANGED IN A
DEAL CABINET, STAINED AND POLISHED, LOCK AND KEY.
EACH SPECIMEN LABELLED AND CATALOGUED.
Price complete, £1 10s.

THE ROCKS illustrate the Order and Range of Deposition, &c.

THE FOSSILS are representative of the Genera found in the most important Deposits.

THE MINERALS are selected for their known uses in the Arts and Manufactures, and are extremely characteristic.

Names and Localities guaranteed.

THOMAS J. DOWNING, Geologist, &c.,
38, WHISKIN STREET, LONDON, E C.
Catalogues Free.

"NASSULA ELEGANS."

These active little Infusoria will be readily recognised with the pocket lens, swimming about the tube. Pritchard describes them as "ovate or globular, depressed, of a brownish-green colour, variegated with numerous violet vesicles. The animalcule swims backward and forward, turning upon its longitudinal axis The mouth is easily perceived by the currents when indigo is mixed with the water; it has a circlet containing twenty-six little wands of teeth, which can voluntarily diverge or converge anteriorly. They are found in stagnant water, especially where Confervæ and Oscillatoriæ are present Only transverse self-division has been observed."

Mr Levick, vice-president of our local society, has favoured me with the specimens I send.

THOS. BOLTON, 17, Ann Street, Birmingham.
Sept. 17th, 1880.

FIRST-CLASS AND THIRD-CLASS AWARDS
AT SYDNEY EXHIBITION
FOR COLLECTIONS FOR TEACHERS AND STUDENTS, OF
MINERALS, FOSSILS, AND ROCKS
Used with success by all Geological Science Teachers in the United Kingdom. Single Specimens, Hammers, and all requisites, of
JAMES R. GREGORY,
Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square
New Lists of Collections, Apparatus, Rock Sections, &c., post free.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address.—CASTLETON, *viâ* SHEFFIELD.

THOMAS D. RUSSELL'S
NATURAL HISTORY STORES,
48, ESSEX STREET, STRAND, W C.

Students and others are invited to inspect the Collections of British and Foreign Shells, Corals, Zoophytes, Annelids, Crustacea, Echinoderms, Minerals, Fossils, Rock Specimens, Microscopic Objects, &c.

Cabinets, Geologist's Hammers, Glass Capped Boxes, Card Trays, Tablets, Glass Slips, Micro- Thin Glass, Canada Balsam, Marine Glue, and other requisites for the Geologist and Microscopist.

Catalogues Post Free.

PROFESSOR TENNANT'S LECTURES on MINERALOGY, applied to GEOLOGY and the ARTS, at King's College. Two Courses are given: one on Saturday Mornings from 10.20 to 11.20, and the other on Thursday Evenings from 8 to 9. The Public are admitted on paying the College fees. The Lectures begin SATURDAY, 9th of October, and terminate at Easter. They are illustrated by a large series of Specimens, chiefly from his Private Collection. Persons unable to attend Public Lectures can have *Private Instruction* in *Mineralogy* and *Geology* of Prof. TENNANT at his residence, 149, Strand, W C. Terms, 7s for Lesson of One Hour.

FOSSILS AND IMPLEMENTS.

MR. BRAUN, lately arrived from America, wishes to inform Principals of Museums, Colleges, Schools, Societies, and the Public in general, that he has now on Exhibition and for Sale at 8, Silver Street (Bury Place), near British Museum, until 30th September, a Collection of magnificent preserved Fossils, Crinoids and others, representing the Silurian, Devonian, Carboniferous, Cretaceous, and Tertiary formations, exclusively of America.

Also a very fine Collection of Indian and Mound Builders' Relics of North American origin.

AGRICULTURAL CHEMISTRY.—Mr. F. J. LLOYD, F.C.S, Assistant in the Laboratory of the Royal Agricultural Society, can receive a few Pupils for Private Instruction in General and Agricultural Chemistry.—Apply 82, Greenwood Road, Dalston.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality Circles 3*s.* 6*d.* per ounce; Squares, 2*s.* 9*d.*; post free 2*d.* extra; Ground edged Slips, 5*s.* per gross: also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N.

NORTH BRITISH AGRICULTURIST is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d.* Annual Subscription, payable in advance, 14*s*.

A TEXT-BOOK OF THE
PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY,
INCLUDING
AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE.
BY ARTHUR GAMGEE, M.D., F.R.S.,
Professor of Physiology in Owens College, Manchester.
LONDON: MACMILLAN AND CO.

This work, of which the first volume is now published, and of which the second and concluding volume will be published in 1881, aims at giving a more complete account of the present state of physiological and pathological chemistry than is to be found in any of the existing text-books. The special features of the work are the following:—

First.—Physiological Chemistry is treated of from the points of view of the physiologist and physician rather than from that of the pure chemist, although no chemical fact and even no chemical speculation is omitted which appears to throw any light upon a biological question. The classification adopted is, however, based upon physiological and pathological rather than chemical considerations.

Secondly.—It has been sought to combine a thoroughly systematic treatment of each subject with a full description of those method of research which have in the past proved of the greatest value to the investigator. In the pursuit of this aim, detailed accounts are given of methods which have, in many cases, hitherto been only incidentally referred to by the systematic writer. It seemed the most important to do this in a work intended for the scientific worker, anxious not merely to learn what had been already acquired to science, but wishful himself to extend her boundaries. Methods of analysis are described with great care, so as to render the work a trustworthy laboratary guide for the student of physiological chemistry and the practical physician.

Thirdly.—The history of each subject treated of is dwelt upon with great thoroughness, a detailed account of all epoch-making researches being given, and the full titles of nearly all papers quoted being given.

Fourthly.—The work is copiously illustrated, the illustrations being in many cases original.

Fifthly.—Whereas in the first volume the chemical composition of and the chemical processes connected with the elementary tissues of the organism are mainly dwelt upon, the second volume will deal with the chemical history of the complex animal processes.

Fourth Edition, Revised, medium 8vo, cloth, 18s.

DESCHANEL'S NATURAL PHILOSOPHY An Elementary Treatise. Translated and Extended by J. D. EVERETT, D.C.L., F.R.S.E., Professor of Natural Philosophy in Queen's College, Belfast Illustrated by 760 Wood Engravings and Three Coloured Plates, and accompanied by a Series of Problems.

Also, separately, in Four Parts, limp cloth, 4s. 6d. each.

Part I.—MECHANICS, HYDROSTATICS, and PNEUMATICS.
Part II—HEAT. Part III.—ELECTRICITY and MAGNETISM.
Part. IV.—SOUND and LIGHT.

"Systematically arranged, clearly written, and admirably illustrated, it forms a model work for a class in experimental physics."—*Saturday Review.*

Fcap. 8vo, cloth, 3s. 6d.

ELEMENTARY TEXT-BOOK OF PHYSICS. By Prof. EVERETT, Translator and Editor of Deschanel's "Natural Philosophy," &c. Illustrated by numerous Woodcuts.

"We have no hesitation in warmly recommending it as a good text-book for junior classes"—*Nature.*

THE ZOOLOGIST:
A MONTHLY MAGAZINE OF NATURAL HISTORY.
Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

MESSRS. MACMILLAN AND CO.'S ANNOUNCEMENTS.

History of the Steam Engine.
By ROBERT L. GALLOWAY. With numerous Illustrations. Crown 8vo.

Graphical Determination of Forces in Engineering Structures. By J. B. CHALMERS. With Illustrations. 8vo.

Text-Book of Geology.
By ARCHIBALD GEIKIE, F.R.S., Professor of Geology, &c., in the University of Edinburgh. With Illustrations. Medium 8vo.

A Treatise on Organic Chemistry.
By H. E. ROSCOE, F.R.S., and C. SCHORLEMMER, F.R.S., Professors of Chemistry in the Owens College, Manchester. With Illustrations. Vol. I.

A Treatise on Comparative Embryology.
By F. M. BALFOUR, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. With Illustrations. Vol. II. 8vo.

Anthropology: an Introduction to the Study of Man and Civilisation. By E. B. TYLOR, F.R.S. With Illustrations. Crown 8vo.

Dr. Francis Sibson's Collected Works.
With Illustrations. Four Vols. 8vo.

Preventive Medicine.
By B. W. RICHARDSON, M.D., F.R.S. 8vo.

Voyage of the "Vega."
By ADOLF ERIK NORDENSKIÖLD. With numerous Illustrations. Medium 8vo.

Island Life; or, the Phenomena of Insular Faunas and Floras, with their Causes, including an entire Revision of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. With Illustrations and Maps. Medium 8vo.

Ideal Chemistry.
By Sir BENJAMIN BRODIE, Bart., F.R.S. Crown 8vo.

Mathematical Papers.
By the late Professor W. K. CLIFFORD, F.R.S. 8vo.

The Aryan Family.
1. Modern Village Life in Bengal.—2. The Agricultural Community in Ceylon.—3. The Joint Family.—4. From the Joint Family to the Village. By Sir JOHN PHEAR, K.C.S.I. Crown 8vo.

Manual of Ancient Geography.
From the German of Dr. H. KIEPERT.

Exercises in Deductive Logic.
By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo.

Guide to the Study of Political Economy.
From the Italian of Dr. LUIGI COSSA, Professor in the University of Pavia. Crown 8vo.

Life and Letters of John T. Delane, late Editor of the *Times*. By Sir GEORGE W. DASENT, D.C.L. 8vo.

MACMILLAN AND CO., LONDON.

J. & A. CHURCHILL, PUBLISHERS.

BENTLEY and TRIMEN'S MEDICINAL PLANTS: being Descriptions, with Original Figures, of the principal Plants employed in Medicine, and an Account of their Properties and Uses. In 4 vols., half morocco, with 306 Coloured Plates, large 8vo. £11 11*s*.

HUXLEY'S MANUAL of COMPARATIVE ANATOMY. With Wood Engravings. Vertebrates, 12*s*.; Invertebrates, 16*s*.

HOWARD on the MODIFICATIONS of CLOUDS. Third Edition, by W. D. and E. HOWARD. With 6 Plates, from Pictures by Kenyon, 4to. 10*s*. 6*d*.

MARTIN'S MANUAL of MICROSCOPIC MOUNTING; with Notes on the Collection and Examination of Objects. Second Edition, with 150 Illustrations, 8vo. 7*s*. 6*d*.

COOLEY'S CYCLOPÆDIA of PRACTICAL RECEIPTS AND COLLATERAL INFORMATION IN THE ARTS, Manufactures, Professions, and Trades, including Medicine, Pharmacy, Hygiene, and Domestic Economy. Designed as a comprehensive supplement to the Pharmacopœia and General Book of Reference for the Manufacturer, Tradesman, Amateur, and Heads of Families. Edited by Prof. TUSON, F.C.S., assisted by several Scientific Contributors. Sixth Edition, 2 vols. 8vo. 42*s*.

VALENTIN'S COURSE of QUALITATIVE ANALYSIS. Edited by W. R. HODGKINSON, Ph.D. (Würzburg), Demonstrator of Practical Chemistry in the Science Schools, South Kensington. Fifth Edition, with 19 Engravings, 8vo. 7*s*. 6*d*.

VALENTIN'S INTRODUCTION to INORGANIC CHEMISTRY. Third Edition, with 82 Engravings, 8vo. 6*s*. 6*d*.

LUFF'S INTRODUCTION to the STUDY of CHEMISTRY, specially designed for Medical and Pharmaceutical Students. Crown 8vo. 2*s*. 6*d*.

CLOWES' PRACTICAL and ANALYTICAL CHEMISTRY, specially adapted for Schools and Colleges, and for Beginners. Third Edition, with 48 Engravings, post 8vo. 7*s*. 6*d*.

ALLEN'S INTRODUCTION TO COMMERCIAL ORGANIC ANALYSIS. Vol. I., Cyanogen Compounds, Alcohols, and their Derivatives, Phenols, Acids, &c. 8vo. 10*s*. 6*d*.

TIDY'S HANDBOOK OF MODERN CHEMISTRY, INORGANIC and ORGANIC. 8vo. 16*s*.

FOWNES' MANUAL of CHEMISTRY. Edited by HENRY WATTS, B.A., F.R.S. Twelfth Edition.

Vol. I.—PHYSICAL and INORGANIC CHEMISTRY. With 154 Engravings. Crown 8vo. 8*s*. 6*d*.

Vol. II.—ORGANIC CHEMISTRY. With Engravings Crown 8vo. 10*s*.

BLOXAM'S CHEMISTRY, INORGANIC and ORGANIC. Fourth Edition, with 295 Engravings on Wood. 8vo. 16*s*.

BLOXAM'S LABORATORY TEACHING; or, Progressive Exercises in Practical Chemistry. Fourth Edition, with 89 Engravings. Crown 8vo. 5*s*. 6*d*.

BOWMAN'S PRACTICAL CHEMISTRY, including ANALYSIS. Edited by Prof. BLOXAM. Seventh Edition, with 98 Engravings. Fcap. 8vo. 6*s*. 6*d*.

BERNAYS' NOTES FOR STUDENTS IN CHEMISTRY: a Syllabus of Chemistry. Sixth Edition. Fcap. 8vo. 3*s*. 6*d*.

BERNAYS' SKELETON NOTES ON ANALYTICAL CHEMISTRY for STUDENTS in MEDICINE. Fcap. 8vo. 2*s*. 6*d*.

KENSINGTON'S CHEMICAL COMPOSITION of FOODS, Waters, Soils, Minerals, Manures, and Miscellaneous Substances. Fcap. 8vo. 5*s*.

LONDON: 11, NEW BURLINGTON STREET.

Practical Physiology and Histology.—Arthur Gamgee, M.D., F.R.S.
Midwifery and Diseases of Women and Children.—John Thorburn, M.D.
Materia Medica and Therapeutics. { Alexander Somers, M.R.C.S. / Daniel John Leech, M.D.
Hygiene and Public Health.—Arthur Ransome, M.D., M A.
Medical Jurisprudence.—Charles J. Cullingworth, M.R.C.P. & S.
Practical Morbid Histology.—Julius Dreschfeld, M.D.
Ophthalmology.—David Little, M.D.
Practical Chemistry.—Henry E. Roscoe, LL.D., F.R.S.
Botany.—W. C Williamson, F.R.S.

Demonstrators in Anatomy. { Alexander Fraser, M.B. / J. Macdonald Brown, M.B.
Demonstrator and Assistant Lecturer in Biology.—Marcus M. Hartog, M.A , B.Sc.

The Lectures in Anatomy, Physiology, and Chemistry are recognised by the University of Edinburgh, and attendance upon any two of these Courses for Six Months will count as one of the Winter Sessions required by the University for the M.B degree.

The next Session will commence on the 1st OCTOBER.

Prospectuses may be obtained from Mr. Cornish and other Booksellers in Manchester, and by application to the Registrar.

J. HOLME NICHOLSON, Registrar.

THE YORKSHIRE COLLEGE.

The SEVENTH SESSION opens October 5th, 1880.

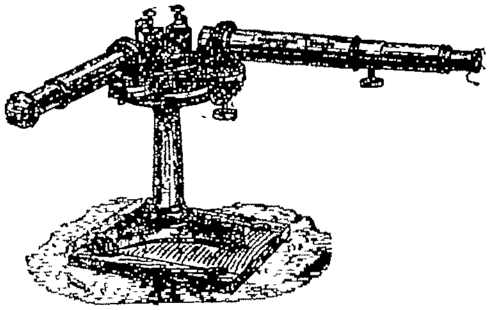
DAY CLASSES in Mathematics, Experimental Physics (Lectures and Laboratory), Chemistry (Lectures and Laboratory), Geology and Mining (Lectures, Practical Classes, and Excursions), Coal Mining, General Biology, Zoology and Comparative Anatomy, Botany, Civil and Mechanical Engineering, Geometrical and Mechanical Drawing, Classics, Ancient and Modern History, English, Language and Literature, Mental and Moral Science, French, German, Oriental Languages, Textile Industries and Dyeing.

LECTURES AND CLASSES FOR OCCASIONAL STUDENTS in Mathematics, Chemistry, Geology, Practical Physiology, Ancient and English Literature, English History, French and German Literature, and Textile Industries.

EVENING LECTURES AND CLASSES in Mathematics, Chemistry, Geology, Zoology, Botany, Engineering, Latin, Greek, Roman History, Political Economy, French, and Textile Industries.

Calendar now ready (1s., by post 1s. 4d.). Prospectus free on application to the Secretary, Cookridge Street, Leeds.

BROWNING'S SPECTROSCOPES.



The Model Spectroscope has two dense glass prisms, two eye-pieces, rack motion to Telescope, and tangent screw to vernier. This instrument will widely separate the D lines.

Price Complete in Polished Mahogany Cabinet, £15.

HOW TO WORK WITH THE SPECTROSCOPE.
By JOHN BROWNING. Price 1s. 6d.

List of Prices of Spectroscopes Free.

JOHN BROWNING, 63, STRAND, LONDON, W.C.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. Ord, M.D., Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examinations of the University of London All Hospital Appointments are open to Students without charge. Scholarships and Prizes to the value of over £300 are awarded at the Sessional Examinations, as also several valuable Silver and Gold Medals. The Fees may be paid in one sum or by instalments; Special Entries may be made to Lectures or to Hospital Practice, and Qualified Practitioners are admitted to Perpetual Attendance for a small Fee. Special arrangements are made for Students joining in their 2nd or subsequent years, and also for Dental Students. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

ST. THOMAS'S HOSPITAL,

ALBERT EMBANKMENT, S.E., MEDICAL SCHOOL.

Two Entrance Scholarships in Natural Science, value £100 and £60 respectively, will be awarded after an Examination, which will be held on October 4th, 5th, and 6th. The Subjects of the Examination will be Chemistry and Physics, with either Botany or Zoology at the option of Candidates. The Examination will be open to all 1st year Students without the Condition of their having first joined as Students of the Hospital.

Full Particulars may be obtained on Application to the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

UNIVERSITY OF LONDON.

MATRICULATION AND PRELIMINARY SCIENTIFIC EXAMINATIONS.

Special CLASSES in all the Subjects will commence at St. Thomas's Hospital Medical School, Albert Embankment, on October 11.

Particulars can be obtained from the Secretary, Dr. GILLESPIE

W. M. ORD, M.D., Dean.

PRELIMINARY SCIENTIFIC EXAMINATION, UNIVERSITY OF LONDON.

A CLASS in all the Subjects (including practical work) for this Examination is held at St. Bartholomew's Hospital, continuing till the Examination in July. The Class is open to Candidates who are not Students of the Hospital, as well as to Students.

Fee for the whole Course (including chemicals), to Students of the Hospital, £8 8s.; to others, £10 10s.

Particulars may be ascertained on application, personally or by letter, to the WARDEN of the College, St. Bartholomew's Hospital, E.C. A Handbook forwarded on application.

MATRICULATION OF THE UNIVERSITY OF LONDON, JANUARY, 1881.

A CLASS in all the Subjects of this Examination will be held at St. Bartholomew's Hospital, beginning MONDAY, October 11th. The Class is not confined to Students of the Hospital

For particulars apply to the WARDEN of the College, St. Bartholomew's Hospital, London, E.C.

A Handbook is forwarded on application.

UNIVERSITY COLLEGE, LONDON.

Professor BONNEY, F R S, will give a Course of Lectures on Geology, on TUESDAYS and THURSDAYS, at One o'Clock, commencing October 7. The subject of the present Term will be Elementary Mineralogy and Petrology.

TALFOURD ELY, M.A, Secretary.

CITY AND GUILDS OF LONDON INSTITUTE FOR THE ADVANCEMENT OF TECHNICAL EDUCATION.

The Executive Committee of this Institute are prepared to award a limited number of FREE ADMISSIONS to the CLASSES in CHEMICAL TECHNOLOGY (Brewing, Alkali Trade, Soap, Glass, &c); in MECHANICAL TECHNOLOGY (Iron and Steel Manufacture, and Strength of Materials) under Professors GRAHAM and KENNEDY, of UNIVERSITY COLLEGE, and also to the Classes in METALLURGY and PRACTICAL FINE ART under Professors HUNTINGTON and DELAMOTTE, of KING'S COLLEGE, London.

In the selection of Candidates preference will be given to Foremen in CHEMICAL WORKS, Artisans, Apprentices, Designers and Artistic Tradesmen.

Applications for admission to be sent in the first instance to the Director and Secretary of the City and Guilds of London Institute, from whom further particulars can be obtained.

PHILIP MAGNUS, Director and Secretary.

Gresham College, E.C.

CITY and GUILDS of LONDON INSTITUTE for the ADVANCEMENT of TECHNICAL EDUCATION.

—Wanted an Assistant accustomed to Physical Laboratory Work, and especially with a Practical Knowledge of Electrical Measurements. Salary Two Pounds a week Testimonials to be sent to Prof AYRTON, Technical School, Cowper Street, Finsbury, London.

SIR JOSIAH MASON'S SCIENCE COLLEGE, BIRMINGHAM.

This COLLEGE will be OPENED on the 1st of October next, with an INTRODUCTORY LECTURE, by Dr. T. H. HUXLEY, F.R.S.

The CLASSES for STUDENTS will COMMENCE on Tuesday, the 5th of October.

The COURSE of INSTRUCTION, as at present arranged, includes—

MATHEMATICS	Professor M. J. M. HILL, M.A.
CHEMISTRY	Professor W. A. TILDEN, D.Sc. Lond., F.R.S.
PHYSICS	Professor J. H. POYNTING, M.A, B.Sc. Lond.
BIOLOGY...	Professor T. W. BRIDGE, M.A., F.Z S.

The course is designed to prepare students for any pursuit in which a practical knowledge of science may be necessary or desirable. The instruction will also be of such a character as will enable students to pass the requisite examinations for the degrees of B.Sc. and D.Sc. of the University of London.

Information as to the terms of admission, and the arrangement of classes, may be obtained on application to Mr. S. Allport, Curator, at the College, Edmund Street, Birmingham. The Professors attend daily at 11 to 12 o'clock at the College, and will be glad to confer with intending Students.

All Departments of the College are Open to Both Sexes on the same terms.

A List of Lodgings suitable for Students may be obtained at the College.

JOSIAH MASON, Founder and Bailiff.
G. J. JOHNSON, Chairman of Trustees.

Birmingham, September 16, 1880.

LIVING SPECIMENS FOR THE MICROSCOPE.

THOMAS BOLTON, NATURALISTS' and MICROSCOPISTS' STUDIO, 17, ANN STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers the Marine Hydrozoan, *Clava squamata*, with sketch and description. He has also sent out *Pedicellina cernua, Alcyonella fungosa, Plumatella repens, Melicerta ringens, Floscularia cornuta, Stephanoceros Eichhornii*, &c.

Weekly announcements will be made in this place of organisms T. B. is supplying.

Specimen Tube, One Shilling, post free.

Twenty-six Tubes in course of Six Months for Subscription of £1 5s.

Price List of Specimens on application with stamped addressed envelope.

Portfolio of Drawings, No 3, One Shilling.

THE MIDDLESEX HOSPITAL.

The WINTER SESSION will open on MONDAY, October 4th, with the Distribution of Prizes in the new Lecture Theatre. H.R.H. The Duke of Cambridge is expected to preside on the occasion. The Medical School, which is now being considerably enlarged, provides the most complete means for the education of Students preparing for the University of London, the Colleges of Physicians and Surgeons, and the other Licensing Bodies.

Two Entrance Scholarships of the annual value of £25 and £20 per annum, tenable for two years, will be competed for on October 1st and 2nd.

Further information may be obtained from the Dean or the Resident Medical Officer at the Hospital. ANDREW CLARK, Dean.

ROYAL SCHOOL OF MINES.

Prof FRANKLAND, D.C.L., F.R.S, will commence a Course of Forty Lectures on "Inorganic Chemistry," on MONDAY next, October 4th, 1880, at 12 o'clock at noon, to be continued on each succeeding Wednesday, Friday, and Monday, at the same hour. Fee for the Course, £4. Laboratory Practice for three months, £12.

Prof. T. H. HUXLEY, LL.D., F.R.S, will commence a Course of Eighty Lectures on Biology or Natural History (including Palæontology), on MONDAY next, October 4th, at 10 o'clock a.m, to be continued on every weekday except Saturday at the same hour. Fee for the Course, £4. For Laboratory Practice, £6.

Prof. T. M. GOODEVE, M.A, will commence a Course of Thirty-six Lectures on Applied Mechanics, on MONDAY next, October 4th, at 10 o'clock a.m, to be continued on every week-day except Saturday at the same hour. Fee for the Course, £3. For supplementary instruction during the rest of the day, £2 2s.

Prof. W. CHANDLER ROBERTS, F R S, will commence a Course of Fifty Lectures on Metallurgy, on MONDAY next, October 4th, at 10 o'clock a.m., to be continued on each succeeding Wednesday, Friday, and Monday at the same hour Fee for the Course, £4. Laboratory Practice (under Mr. R. Smith) for three months, £12.

All these Lectures will be delivered at the Science Schools, Exhibition Road, South Kensington.

F. W. RUDLER, Registrar.

FIRTH COLLEGE, SHEFFIELD.

SESSION 1880–81.

Day Lectures and Classes begin on WEDNESDAY, October 6th.

Evening Lectures and Classes on MONDAY, October 11th.

There is a good Chemical Laboratory, with fittings and appliances of the most approved kind.

In addition to the regular College Classes there will be a Course of Lectures on Biology, by Rev. W. H. Dallinger, F.R.S.

Prospectus with full particulars on application to the REGISTRAR.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

AGRICULTURAL EDUCATION.

The Examination of Candidates for the Society's Junior Scholarships, value £20 each, will take place in November next. Notice of Candidature must be received on or before OCTOBER 1st.

Copies of the Regulations may be had on application to

H. M. JENKINS, Secretary.

12, Hanover Square, London, W.

EVENING SCIENCE LECTURES.—Mr.

W. J. WILSON, F.C.S., M.S.T.E. (Demonstrator of Practical Physics at South Kensington), will commence a Course of about Sixty Lectures on Electricity, Magnetism, Light, Heat, and Sound in the Theatre of the Birkbeck Institution, Southampton Buildings, W.C, on FRIDAY, October 8th, at 8 o'clock; to be continued on succeeding Fridays, at the same hour, and terminating with the Government Examinations in May. Fee for the Course, 8s. For detailed syllabus, particulars of special prizes, &c., apply to the Librarian.

PHOTOGRAPHY.

A Course of Instruction in Theoretical and Practical Photography by Mr. JOHN M. THOMSON, F.R.S.E, in connection with the King's College Applied Science Department, will commence in OCTOBER, and be continued during the Session on Mondays, from 11.15 to 1.15. Extra Instruction will also be given by special arrangement.

CHEMISTRY.

A Course of Lectures on Inorganic and Organic Chemistry will be given by Mr. JOHN M. THOMSON, F.R.S.E, in connection with the King's College Evening Class Department, from OCTOBER till EASTER, on Mondays and Thursdays, from 7 to 8 p.m. A Class in Practical Chemistry will also be held on Tuesdays, from 7 to 9 p.m.

For particulars apply to the SECRETARY, King's College, Strand, W.C.

Sale by Auction.

Choice Exotic Butterflies, Cabinets, &c.

MR. J. C. STEVENS will Sell by Auction, at his Great Rooms, 38, King Street, Covent Garden, on FRIDAY, October 8th, at half-past 12 precisely, a very choice Typical Collection of Exotic Butterflies, containing 2,000 Species carefully named The Collection contains a great number of the rarest Butterflies: Papilio Antimachus (West Africa), Homerus (Jamaica), Anten, or choice Charaxes, Harma Aterica, Epitola, Godartia, Romaleosoma, and other rare Equatorial African Butterflies, also beautiful and rare Species from all parts of the world, four 20-drawer Mahogany Cabinets, &c, &c; also fine and complete Works on Exotic Lepidoptera, Doubleday and Hewitson's Genera of Diurnal Lepidoptera, and Cramer's Papillons Exotiques, Felder's Exotic Butterflies, Hewitson's ditto; also various lots of rare British and Exotic Lepidoptera and Coleoptera, preserved Larvæ, Birds' Skins, &c.

On view after 2 o'clock the day prior and morning of Sale, and Catalogues had.

WANTED to HIRE for THREE MONTHS, a Binocular Microscope and Appurtenances Security or References given.—Address Q A, May's Advertising Office, 159, Piccadilly.

PROFESSOR TENNANT'S LECTURES on MINERALOGY, applied to GEOLOGY and the ARTS, at King's College. Two Courses are given: one on Saturday Mornings from 10.20 to 11 20, and the other on Thursday Evenings from 8 to 9 The Public are admitted on paying the College fees The Lectures begin SATURDAY, 9th of October, and terminate at Easter. They are illustrated by a large series of Specimens, chiefly from his Private Collection. Persons unable to attend Public Lectures can have *Private Instruction* in *Mineralogy* and *Geology* of Prof. TENNANT at his residence, 149, Strand, W C. Terms, 7s for Lesson of One Hour

---

THE POST OF ATTENDANT AT THE Cavendish Laboratory is now filled Lord RAYLEIGH regrets that it is impossible for him to answer individually the very numerous applications which he has received.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

A YOUNG ENGLISH CHEMIST, Ph.D. (Wurzburg), desires an Appointment as DEMONSTRATOR or PRIVATE ASSISTANT —Address "CHEMIST," NATURE Office, 29, Bedford Street, Strand.

MINERALOGY AND GEOLOGY.

FINE SPECIMENS OF THE NEW MINERAL
ONTARIOLITE, METEORIC STONE, Waconda;
METEORIC IRON, Estherville;
VERY BRILLIANT CRYSTALS OF RUTILE, America;
CRYSTALLISED EUXENITE, Norway;
CRYSTALS OF EMERALD, Mexico;
FINE POLISHED SLABS OF MICROLINE AND LABRADORITE.
COLLECTIONS FOR STUDENTS, from £2 2s.
COLLECTIONS FOR BEGINNERS, from 4s.
BLOWPIPE CASES AND APPARATUS.
PRIVATE LESSONS AND EVENING CLASSES.
Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON, W.C.

Mr. HENSON'S usual Course of EVENING LECTURES will commence First Week in OCTOBER.

Price 3s. Quarterly; Yearly, 12s, post free.

MIND: No. XX.

I. Æsthetic Evolution in Man By G. Allen.
II. The Unity of the Organic Individual (concluded) By E Montgomery.
III. Another View of Mr Spencer's Ethics. By A. W. Benn.
IV. Botanical Classification By W. L Davidson
V. The Method of Kant. By J. Watson
With Critical Notices, Notes and Discussions, &c, by Prof KNIGHT, Dr BAIN, Prof. ADAMSON, and others.

WILLIAMS & NORGATE, London and Edinburgh

FIRST-CLASS AND THIRD-CLASS AWARDS

AT SYDNEY EXHIBITION
FOR COLLECTIONS FOR TEACHERS AND STUDENTS, OF MINERALS, FOSSILS, AND ROCKS

Used with success by all Geological Science Teachers in the United Kingdom. Single Specimens, Hammers, and all requisites, of

JAMES R GREGORY,
Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square
New Lists of Collections, Apparatus, Rock Sections, &c, post free

---

50 ROCKS, 50 FOSSILS, 50 MINERALS,

NEATLY ARRANGED IN A
DEAL CABINET, STAINED AND POLISHED, LOCK AND KEY.
EACH SPECIMEN LABELLED AND CATALOGUED.
Price complete £1 10s.

THE ROCKS illustrate the Order and Range of Deposition, &c.

THE FOSSILS are representative of the Genera found in the most important Deposits.

THE MINERALS are selected for their known uses in the Arts and Manufactures, and are extremely characteristic.

Names and Localities guaranteed.

THOMAS J. DOWNING, Geologist, &c.,
38, WHISKIN STREET, LONDON, E.C.
Catalogues Free.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices Catalogues post free.

Postal Address:—CASTLETON, *via* SHEFFIELD.

In fcap. 8vo, price 3s. 6d.

SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic.*

MACMILLAN & CO., LONDON.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

On the 1st of every Month, price Sixpence.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,
With the Assistance of
FREDERICK BOND, F.Z.S. | JOHN A. POWER, M.D.
EDWARD A. FITCH, F.L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

Now ready, post quarto, cloth gilt, 272 pages Price 16s.

LIGHTNING CONDUCTORS:

THEIR

HISTORY, NATURE, AND MODE OF APPLICATION.

By RICHARD ANDERSON, F.C.S., F.G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.
With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York: 446, Broome Street 1880.

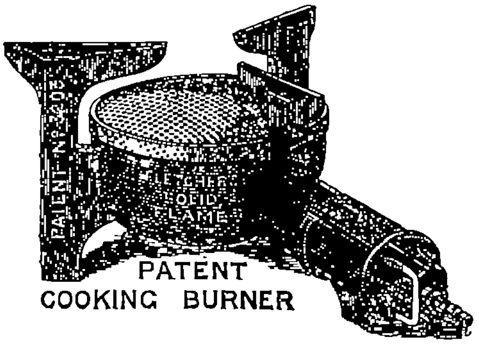
FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.

[PATENT, 3,203.]

The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work. This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt. The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.

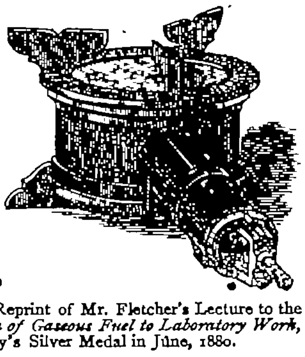


PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.

A SMALLER SIZE IN PREPARATION.

ORIGINAL SOLID FLAME BURNER.

PRICE, with Gauze, 4s.; or Nickel-Plated, 5s.



These Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot. They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas.

GAS FIRE, an Attachment to the above, making a first-rate Gas Fire, is in preparation.

Complete Illustrated List, Price 3*d*., of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c; Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c., with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

Particulars may be ascertained on application, personally or by letter, to the Warden of the College, St. Bartholomew's Hospital, E.C. A Handbook forwarded on application.

MATRICULATION OF THE UNIVERSITY OF LONDON, JANUARY, 1881.

A CLASS in all the Subjects of this Examination will be held at St. Bartholomew's Hospital, beginning MONDAY, October 11th. The Class is not confined to Students of the Hospital

For particulars apply to the Warden of the College, St. Bartholomew's Hospital, London, E.C.

A Handbook is forwarded on application.

UNIVERSITY OF LONDON.

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION.

Instruction is given in all the Subjects of the above Examination at Guy's Hospital during the Winter and Summer Sessions. The Class is not confined to Students of the Hospital.

For further particulars apply to the Dean, Guy's Hospital, Southwark, S.E.

INSTITUTE OF CHEMISTRY.

PRIZES.

Dr. FRANKLAND has offered a Prize of £50 for the best Original Investigation involving Gas Analysis, and Dr C. MEYMOTT TIDY has also offered a Prize of £25 for the best Original Investigation on Special Reactions of the Alkaloids and their Separation from Organic Mixtures. These prizes will be open to Associates, and to all persons (except Fellows of the Institute) who shall, before the 31st of December next, have qualified for the Associateship in all respects, short of passing the prescribed practical examination; and successful competition for these prizes will be accepted in lieu of such practical examination.

Further information may be obtained on application to the Secretary, Mr. C. E. Groves, Somerset House Terrace, W.C.

NEW COLOUR EXPERIMENT,

BY LORD RAYLEIGH, F.R.S.

This combination of absorbing media is intended to exhibit a compound yellow, *i.e.* a yellow resulting from the mixture of red and green prismatic rays, and thus to illustrate a fundamental point in the theory of colour—*that yellow is not, as is usually supposed, a simple or primary colour.* The blue glass, inclosing a film of gelatine stained with litmus, is opaque to the yellow and orange rays of the spectrum, the yellow glass, coloured in like manner with aurine, stops the blue and violet rays. The combination therefore transmits only red and green rays. The result of the mixture is yellow or orange, as appears when the glasses are held up against a well-lighted cloud. The character of the light transmitted by either glass separately or by both together may be examined with any simple spectroscope, or with a loose prism and a slit in a piece of blackened cardboard.

Price of the pair of Disks, mounted, 6s.; by post, 6s. 3d.

JOHN BROWNING,

63, STRAND, LONDON, W.C.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The WINTER SESSION 1880-1 will commence on October 1, when an Introductory Address will be delivered by W. M. Ord, M.D., Dean of the School, at 3 p.m. Two entrance Science Scholarships of £100 and £60, open to all 1st year Students, will be offered for competition in the first week of October. The subjects of the examination will be Chemistry and Physics, with either Botany or Zoology, at the option of Candidates. Special Classes are held throughout the year for the Matriculation, Preliminary, Scientific, and 1st M.B. Examinations of the University of London. All Hospital Appointments are open to Students without charge. Scholarships and Prizes to the value of over £300 are awarded at the Sessional Examinations, as also several valuable Silver and Gold Medals. The Fees may be paid in one sum or by instalments, Special Entries may be made to Lectures or to Hospital Practice, and Qualified Practitioners are admitted to Perpetual Attendance for a small Fee Special arrangements are made for Students joining in their 2nd or subsequent years, and also for Dental Students. Several Medical Practitioners in the neighbourhood receive Students for residence and supervision, and a register of inspected and approved lodgings is kept in the Secretary's office.

Prospectus and all particulars can be obtained from the Secretary, Dr Gillespie.

W. M. ORD, M.D., Dean.

FIRTH COLLEGE, SHEFFIELD.

SESSION 1880–81.

Day Lectures and Classes begin on WEDNESDAY, October 6th.

Evening Lectures and Classes on MONDAY, October 11th.

There is a good Chemical Laboratory, with fittings and appliances of the most approved kind

In addition to the regular College Classes there will be a Course of Lectures on Biology, by Rev. W. H. Dallinger, F.R.S.

Prospectus with full particulars on application to the Registrar.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

Catalogues post free and gratis on application.

NEW EDITION, 1880, NOW READY.

ROYAL POLYTECHNIC.—CLASSES for

the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

ISLINGTON SCHOOL OF SCIENCE AND ART,

WINDSOR STREET, ESSEX ROAD, N.

EVENING SCIENCE CLASSES under the direction of Mr. J HOWARD, F.C.S, Demonstrator of Practical Chemistry at the Borough Road Training College.

Inorganic Chemistry and Practical Chemistry on Fridays, 6.30 to 10; Sound, Light, and Heat and Electricity on Wednesday Evenings, 7 30 to 9 30. Teacher, Mr. ISAAC SCARF, F.C.S. (Assistant Lecturer on Chemistry and Experimental Physics at the City of London School, &c.).

MINERALOGY AND GEOLOGY.

DOUBLY TERMINATED CRYSTALS OF EPIDOTE, Tyrol;
CRYSTALS OF POLYCRASE, CORDIERITE, AUGITE, BONODOFFITE, Norway;
METEORIC IRON, Estherville;
APATITE, LAZULITE, RUTILE, ONTARIOLITE, STAUROLITE, AUGITE, TOURMALINE, QUARTZ with Liquid, America;
FINE POLISHED SLABS OF MICROLINE AND LABRADORITE.

COLLECTIONS FOR STUDENTS, from £2 2s.
COLLECTIONS FOR BEGINNERS, from 4s.
BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,
277 (*Late* 113*a*), STRAND, LONDON.

Mr. HENSON'S usual Course of EVENING CLASSES will commence Tuesday, OCTOBER 12th, at 7.30.

---

50 ROCKS, 50 FOSSILS, 50 MINERALS,

NEATLY ARRANGED IN A
DEAL CABINET, STAINED AND POLISHED, LOCK AND KEY.
EACH SPECIMEN LABELLED AND CATALOGUED.

Price complete, £1 10s.

THE ROCKS illustrate the Order and Range of Deposition, &c.

THE FOSSILS are representative of the Genera found in the most important Deposits.

THE MINERALS are selected for their known uses in the Arts and Manufactures, and are extremely characteristic.

Names and Localities guaranteed.

THOMAS J. DOWNING, Geologist, &c.,
38, WHISKIN STREET, LONDON, E.C.
Catalogues Free.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	[illegible]	0

More extensive Collections at 50 to 5,000 Guineas each.

FIRST-CLASS AND THIRD-CLASS AWARDS

AT SYDNEY EXHIBITION

FOR COLLECTIONS FOR TEACHERS AND STUDENTS, OF MINERALS, FOSSILS, AND ROCKS

Used with success by all Geological Science Teachers in the United Kingdom. Single Specimens, Hammers, and all requisites, of

JAMES R. GREGORY,
Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square
New Lists of Collections, Apparatus, Rock Sections, &c., post free.

LIVING SPECIMENS FOR THE MICROSCOPE.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

THE MECHANICAL THEORY OF HEAT.

BY R. CLAUSIUS.

Translated by WALTER R. BROWNE, M.A., Late Fellow of Trinity College, Cambridge.

MACMILLAN AND CO., LONDON.

Just Published.

A MANUAL OF PALÆONTOLOGY.

FOR THE USE OF STUDENTS.

WITH A GENERAL INTRODUCTION ON THE PRINCIPLES OF PALÆONTOLOGY.

BY H. ALLEYNE NICHOLSON,

M.D., D.Sc., F.R.S.E., &c.,

Professor of Natural History in the University of St. Andrew's,
Author of "A Manual of Zoology," &c.

Second Edition, Revised and greatly Enlarged. With a Glossary and Index.

Two Volumes Octavo, with 722 Illustrations, £2 2*s*.

"The most complete and systematic treatise on the subject in the English language It has not only been thoroughly revised, and to a great extent rewritten, but so much enlarged by the addition of new matter that it may claim to be considered, to all intents and purposes, a new book."—*Saturday Review*, 25th Sept., 1880.

"There is a wonderful charm of simplicity and clearness about the composition: the indefinable touch of genius lights up the pages, and the most general reader must be stolid indeed who does not follow the author with an interest running hard upon enthusiasm. . . . . The illustrations are not only profuse and scientifically accurate, but exhibit for the most part a pictorial delicacy and vividness such as must satisfy the most exacting connoisseur in this kind of art."—*London Quarterly Review.*

"It is certainly the best book of its kind for the use of students, and for the general reader, which we possess."—*Geological Magazine.*

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

Fourth Edition, Revised, medium 8vo, cloth, 18*s*.

GRAHAM MEDAL.

The TRIENNIAL GOLD MEDAL of the Chemical Section of the Philosophical Society of Glasgow, founded in commemoration of the work of THOMAS GRAHAM, F.R.S., late Master of the Mint, will be awarded at the end of the present Session for the Best Paper on any subject in Pure or Applied Chemistry.

Authors are requested to send in their Papers, not later than 1st February, 1881, addressed to the Secretary of the Section, Dr J. J. DOBBIE, Chemical Laboratory, University of Glasgow.

TRINITY COLLEGE, LONDON.

CHEMISTRY.

Lecturer—R. H SCANES SPICER, B Sc

A Course of Lectures will be commenced on FRIDAY, October 15th, at Eight o'clock, and continued on Fridays during Term. The first Lecture will be an introductory one, with some specially arranged experiments, for which a limited number of Free Tickets will be issued.

Fee for the Course, One Guinea.

A Syllabus and further particulars may be obtained from the SECRETARY, Trinity College, London (Mandeville Place, Manchester Square).

INTERMEDIATE EDUCATION BOARD FOR IRELAND.

EXAMINERS, 1881.

The INTERMEDIATE EDUCATION BOARD are now prepared to receive Applications from Gentlemen who desire to have their names placed upon the List from which the Examiners for 1881 will be selected.

The following are the Subjects of Examination, viz.—Greek, Latin, English, French, German, Italian, Celtic, Mathematics, Arithmetic and Book-keeping, Natural Philosophy (Experimental Physics), Chemistry, Botany, and Animal Physiology, Physical Geography, Drawing, Music.

Applications, addressed to the Assistant Commissioners, and endorsed "Examiner," should be sent in on or before the 1st of November next.

By Order,

ARTHUR HILL CURTIS, } Assistant
T J. BELLINGHAM BRADY, } Commissioners.

1, Hume Street, Dublin, 11th October, 1880.

FOR SALE.—EQUATORIAL TELESCOPE and OBSERVATORY, the property of the late Rev R. J. GOULD, Mortimer Vicarage, Reading The Object-glass is an exceptionally fine one of 5-in. diameter, made by COOKE for the London International Exhibition of 1862, and the Fittings of the Instrument are very complete, including Driving Clock, Slow Motions in R A. and Declination, and all requisite adjustments, &c., Micrometer with Position-circles and Illuminating Lamp, full Battery of Astronomical Eyepieces, Dawes' Solar Eyepiece, Comet Eyepiece, Solar Prism, Star Spectroscope, &c., &c.

The OBSERVATORY is strongly built of Wood, with Copper Dome 10 feet diameter, revolving on pulleys on iron rail, and with Sliding Shutter.—Apply to Mrs. GOULD, Mortimer Vicarage, Reading, or to T COOKE AND SONS, Buckingham Works, York.

ROYAL POLYTECHNIC.—CLASSES for the preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

NEW COLOUR EXPERIMENT,
BY LORD RAYLEIGH, F.R.S.

This combination of absorbing media is intended to exhibit a compound yellow, *i.e.* a yellow resulting from the mixture of red and green prismatic rays, and thus to illustrate a fundamental point in the theory of colour—*that yellow is not, as is usually supposed, a simple or primary colour.* The blue glass, inclosing a film of gelatine stained with litmus, is opaque to the yellow and orange rays of the spectrum, the yellow glass, coloured in like manner with aniline, stops the blue and violet rays. The combination therefore transmits only red and green rays. The result of the mixture is yellow or orange, as appears when the glasses are held up against a well-lighted cloud. The character of the light transmitted by either glass separately or by both together may be examined with any simple spectroscope, or with a loose prism and a slit in a piece of blackened cardboard.

Price of the pair of Disks, mounted, 6s.; by post, 6s. 3d.

JOHN BROWNING,
63, STRAND, LONDON, W.C.

BLASCHKA MODELS IN NATURAL HISTORY.—Having appointed MR. DAMON of Weymouth SOLE AGENT for the Sale and Supply of my Glass Models in Great Britain, I request all orders and communications from Great Britain and Ireland to be made to him.

L. BLASCHKA, Dresden.

THIN GLASS FOR MICROSCOPIC MOUNTING, of best quality. Circles, 3s. 6d. per ounce; Squares, 2s. 9d.; post free 2d. extra; Ground edged Slips, 5s. per gross: also other Mounting Materials and Objects prepared for mounting.—CHAS. PETIT, 151, High Street, Stoke Newington, N

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

NOW READY.

THE ATOMIC THEORY.

By PROF. AD. WURTZ.

Translated by E CLEMINSHAW, F.C.S.

Crown 8vo, cloth, price 5s.

⁂ Vol. XXX. of the *International Scientific Series.*

London: C. KEGAN PAUL & CO, 1, Paternoster Square.

NEW WORK BY LIONEL S BEALE.

Now ready, pp. 230, demy 8vo, 5s.

SLIGHT AILMENTS:

THEIR NATURE AND TREATMENT.

By LIONEL S. BEALE, M.B., F.R.S., F.R.C.P.,
Professor of the Principles and Practice of Medicine in King's College, London.

J. & A. CHURCHILL, New Burlington Street.

Demy 4to, Cloth, with 18 Plates, price £2 2s.

AURORÆ: their Characters and Spectra

By J. RAND CAPRON, F.R.A.S.

Part I.—THE AURORA AND ITS CHARACTERS.
Part II.—THE SPECTRUM OF THE AURORA.

London: E. & F. N. SPON, 46, Charing Cross.

THE VICTORIA UNIVERSITY

THE OWENS COLLEGE CALENDAR

for the Session 1880-1. Price 3s., by post 3s. 6d.

THE JOURNAL OF ANATOMY AND PHYSIOLOGY

NORMAL AND PATHOLOGICAL.

CONDUCTED BY
Profs. HUMPHRY, TURNER, M'KENDRICK, & Dr. CREIGHTON

Vol. XV., Part I., October, 1880, Price 6s.

Contents.

1. Infective Form of Tuberculosis in Man identical with Bovine Tuberculosis. By C. Creighton, M D. (Plates I—VI)
2. Tertiary Occipital Condyle. By W. Allen, M.D. (Plate VII)
3. Some Points in Histology of Cirrhosis of Liver. By J. Dreschfeld, M D. (Plate VIII.)
4. Contribution to Pathological Anatomy of Lead Paralysis By S. Mortix, M.D. (Plate IX)
5. Vascular Lesions in Hydrophobia and in other Diseases characterised by Cerebral Excitement. By G. S. Middleton, M.B (Plate X.)
6. Ether Percolator, for use in Physiological or Pathological Laboratories. By D Macphail, M.B. (Plate XI.)
7. Comparative Value of Chloroform and Ethidene Dichloride as Anæsthetic Agents. By D Newman, M.B.
8. Observations on Temperature of Healthy Human Body in Various Climates. By R. Pinkerton, M.B. (Plate XII.)
9. Lymphatics of Cartilage or of Perichondrium By G. Hoggan, M.B., and F. E Hoggan, M.D (Plate XIII)
10. Palatine Branch from Middle Meningeal Artery. By R. J. Anderson, M D.
11. Muscular Anomalies. By J. F. Knott.

MACMILLAN & CO., London and Cambridge.

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ, M.P.

THE CHAMBER OF AGRICULTURE JOURNAL

AND FARMERS' CHRONICLE
(PRICE 3d. WEEKLY)

The representative organ of the Central and Provincial Chambers of Agriculture, *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming the Dairy, Herd and Flock News, Horticulture, &c., &c It is despatched every Monday evening in time for the country post

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.C.

Extra fcap. 8vo, 3s. 6d.

METALS and their CHIEF INDUSTRIAL APPLICATIONS.

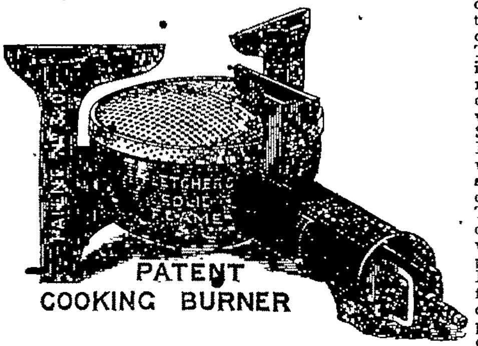
FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.

[PATENT, 3,203.]

The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose Perforated Dome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.

A SMALLER SIZE IN PREPARATION.

ORIGINAL SOLID FLAME BURNER.

PRICE, with Gauze, 4s.; or Nickel-Plated, 5s.

These Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas

Complete Illustrated List, Price 2*d.*, of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c., Hot and Cold Blast Blowpipes, Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success, is the most Reliable, most Effective, and Cheapest Conductor ever offered to the public

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which is safe in any storm.

A TEXT-BOOK OF THE

PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY,

INCLUDING

AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE.

BY ARTHUR GAMGEE, M.D., F.R.S.,

Professor of Physiology in Owens College, Manchester.

LONDON: MACMILLAN AND CO.

This work, of which the first volume is now published, and of which the second and concluding volume will be published in 1881, aims at giving a more complete account of the present state of physiological and pathological chemistry than is to be found in any of the existing text-books. The special features of the work are the following:—

First.—Physiological Chemistry is treated of from the points of view of the physiologist and physician rather than from that of the pure chemist, although no chemical fact and even no chemical speculation is omitted which appears to throw any light upon a biological question. The classification adopted is, however, based upon physiological and pathological rather than chemical considerations.

Secondly.—It has been sought to combine a thoroughly systematic treatment of each subject with a full description of those methods of research which have in the past proved of the greatest value to the investigator. In the pursuit of this aim, detailed accounts are given of methods which have, in many cases, hitherto been only incidentally referred to by the systematic writer. It seemed the most important to do this in a work intended for the scientific worker, anxious not merely to learn what had been already acquired to science, but wishful himself to extend her boundaries. Methods of analysis are described with great care, so as to render the work a trustworthy laboratory guide for the student of physiological chemistry and the practical physician.

Thirdly.—The history of each subject treated of is dwelt upon with great thoroughness, a detailed account of all epoch-making researches being given, and the full titles of nearly all papers quoted being given.

Fourthly.—The work is copiously illustrated, the illustrations being in many cases original.

Fifthly.—Whereas in the first volume the chemical composition of and the chemical processes connected with the elementary tissues of the organism are mainly dwelt upon, the second volume will deal with the chemical history of the complex animal processes.

PATERSON'S APPARATUS FOR LECTURES AND SCIENCE CLASSES.

New List of APPARATUS, LANTERNS, and LANTERN SLIDES for SCIENTIFIC LECTURES, with Terms of Hire. Post free.
Complete Sets of Physical Apparatus for Science Primers and all the Physical Text-books in use in Schools and Colleges.
Siemens and Gramme Dynamo Machines and Lamps for hire.
Schools supplied with Apparatus as per Science and Art Departments' Requirements in the Sections of Light, Heat, Sound, and Electricity.
Electric Signals for Houses, Hotels, &c., Colliery Signals, Lightning Conductors, Gower and other Patent Telephones.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.
Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year

Vols I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10s. each; the succeeding vols. may be had separately or together, at 7s. each.

London: JOHN VAN VOORST, 1, Paternoster Row

N.B.—Communications, &c., should be sent to the Editors at the above address.

HOLLOWAYS PILLS THIS MEDICINE

Is a Certain Cure for all Disorders of the LIVER, STOMACH AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds, distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"*To the solid ground*
Of Nature trusts the mind which builds for aye."—WORDSWORTH

No. 573, Vol. 22] THURSDAY, OCTOBER 21, 1880 [Price Sixpence

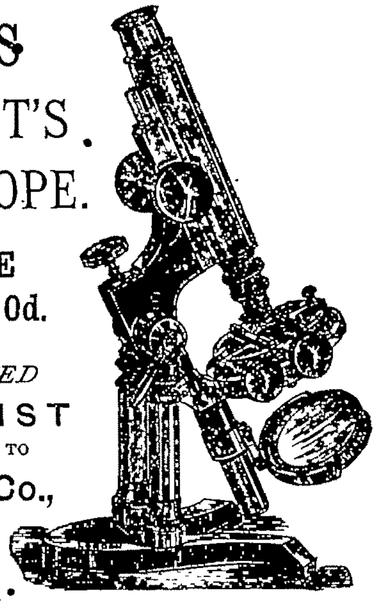
Registered as a Newspaper at the General Post Office.] [All Rights are Reserved.

ROSS'S STUDENT'S MICROSCOPE.

PRICE £10 10s. 0d.

ILLUSTRATED PRICE LIST ON APPLICATION TO

ROSS & Co.,
164, New Bond Street.



GRAHAM MEDAL.

The TRIENNIAL GOLD MEDAL of the Chemical Section of the Philosophical Society of Glasgow, founded in commemoration of the work of Thomas Graham, F.R.S., late Master of the Mint, will be awarded at the end of the present Session for the Best Paper on any subject in Pure or Applied Chemistry.

Authors are requested to send in their Papers, not later than 1st February, 1881, addressed to the Secretary of the Section, Dr. J. J. Dobbie, Chemical Laboratory, University of Glasgow.

PHYSIOGRAPHY.

MR J. Y. BUCHANAN will deliver a Course of Lectures on Physiography, including Meteorology and the Application of Experimental Science, especially Chemistry, to the investigation of Natural Phenomena, in his Lecture-room, No 11, Nicolson Square, Edinburgh, on Tuesdays and Thursdays during the Winter Session beginning on Tuesday, 9th November, 1880. Fee for the Course Two Guineas.

APPRENTICESHIP SCHOOL OF MECHANICAL ENGINEERING.

Superintendent of Workshops S. PICKLER, Esq. Lectures by JOHN BOURNE, Esq. (Author of various Works on the Steam Engine), by Mr. LAWRIE, Past President of Institute of Engineers and Shipbuilders in Scotland. For particulars apply to Secretary, Polytechnic, 309, Regent Street, London.

NEW COLOUR COMBINATION PLATES,

DEVISED BY LORD RAYLEIGH, F.R.S., &c.,

FOR DEMONSTRATING THE COMPOUND NATURE OF YELLOW LIGHT AS A MIXTURE OF RED AND GREEN.

The Yellow Disc absorbs the Blue Light.

The Blue Disc absorbs the Yellow and Orange Light.

By superposing the Discs, and viewing a White Object, as a Cloud, the Resultant Light will be Yellow. But on analysing the same with a Spectroscope, it is proved that Yellow Light is produced by a mingling of Red and Green, since these Rays of the Spectrum are alone transmitted; neither Orange nor Yellow are present in the Spectrum.

Price of the pair of Discs, 6s.; by post, 6s. 3d.

JOHN BROWNING,
63, STRAND, LONDON, W.C.

THE LONDON LIBRARY,

12, ST. JAMES'S SQUARE, S.W.

---

50 ROCKS, 50 FOSSILS, 50 MINERALS,

NEATLY ARRANGED IN A
DEAL CABINET, STAINED AND POLISHED, LOCK AND KEY.
EACH SPECIMEN LABELLED AND CATALOGUED.

Price complete, £1 10s.

THE ROCKS illustrate the Order and Range of Deposition, &c.

THE FOSSILS are representative of the Genera found in the most important Deposits

THE MINERALS are selected for their known uses in the Arts and Manufactures, and are extremely characteristic.

Names and Localities guaranteed.

THOMAS J. DOWNING, Geologist, &c.,
38, WHISKIN STREET, LONDON, E.C.

Catalogues Free.

GEOLOGY AND MINERALOGY.

JOHN TYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices Catalogues post free.

Postal Address:—CASTLETON, *viâ* SHEFFIELD.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays	£2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

MUSEUMS AND COLLECTORS.

MR. DAMON, of WEYMOUTH, will forward an abridged Catalogue of his Collections in Natural History Objects, including RECENT SHELLS (Foreign and British), FOSSIL REMAINS, MINERALS, ROCKS, MARINE ZOOLOGY, &c., &c., &c.

"CHALLENGER" EXPEDITION,

MICROSCOPIC PREPARATIONS FROM,
Per Sir WYVILLE THOMSON

24 Soundings correctly marked, Lat., Long., Depth, &c., in Box, 30s.

Also, 24 Injected Preparations illustrating Anatomy of the Monkey, in Box, 21s.

JOHN MURRAY, Albemarle Street

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d Annual Subscription, payable in advance, 14s.
Office—377, High Street, Edinburgh
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE COBHAM JOURNALS: Abstracts and SUMMARIES OF METEOROLOGICAL AND PHENOLOGICAL OBSERVATIONS, made by Miss CAROLINE MOLESWORTH, at Cobham, Surrey, in the Years 1825 to 1850. With Introduction, Tables, &c., by ELEANOR A. ORMEROD, F.M.S.

"These journals are so full of notes on the ever-varying phenomena of the atmosphere and of the influence of these alternations upon the phenomena of plant life, on the conditions of insect development, and on the appearance and the song of birds, that Miss Molesworth has well earned remembrance as a pioneer, as well as a true and hearty worker, in this branch of research."—*Athenæum.*

Crown 8vo, 570 pp., cloth, 12*s.* 6*d.*

THE PROGRESS OF THE WORLD, in ARTS, AGRICULTURE, COMMERCE, MANUFACTURES, INSTRUCTION, RAILWAYS, AND PUBLIC WEALTH, SINCE THE BEGINNING OF THE NINETEENTH CENTURY. By MICHAEL G. MULHALL, F.S.S., Author of "The English in South America," "Handbook to the River Plate Republics," "Handbook to Brazil," &c.

"This is in many ways a remarkable book. It gives statistical information in a highly condensed form respecting every country in the world whence such information can be obtained. The statements given are well arranged and clear. The topics dealt with include almost every subject of material interest to the welfare of mankind. It would be difficult, if not impossible, to name another book which gives so much information of the same description in so small a space."—*Economist.*

Demy 8vo, Illustrated with 8 Plates (containing numerous Figures) and 25 Woodcuts, cloth, 8*s.* 6*d.*

ON THE INFLUENCE OF COLLOIDS UPON CRYSTALLINE FORM AND COHESION, With Observations on the Structure and Mode of Formation of Urinary and other Calculi. By WILLIAM MILLER ORD, M.D Lond., F.R.C.P., F.L.S., Physician to St. Thomas's Hospital, &c.

"The entire treatise forms an important contribution to medical and scientific literature, and an almost indispensable addition to the library of every practising physician."—*Lancet.*

Post 8vo, with 40 Illustrations and Maps, cloth, 1*s.*

GEOGRAPHY FOR LITTLE CHILDREN. By ANTONIA ZIMMERN.

"The language is simple, the type large and clear, while the pages are enlivened by some good maps and many illustrations. These, we are sure, cannot fail to prove very winning to all such little folk as the 'Dolly, Fantie, and Too Too,' to whom this little volume is dedicated."—*Saturday Review.*

Crown 8vo, with upwards of 100 Illustrations.

LIFE AND HER CHILDREN: Glimpses OF ANIMAL LIFE FROM THE AMŒBA TO THE INSECTS. By ARABELLA B. BUCKLEY, Authoress of "The Fairy-Land of Science," "A Short History of Natural Science," "Botanical Tables for the use of Junior Students," &c.

CONTENTS:—Chapter I. Life and Her Children.—II. Life's Simplest Children: how they live, and move, and build.—III. How Sponges live.—IV. The Lasso-throwers of the Ponds and Oceans. —V. How Starfish walk and Sea-Urchins grow.—VI. The Mantle-covered Animals and how they live with heads and without them.—VII. The Outcasts of Animal Life, and the Elastic-ringed Animals by Sea and by Land.—VIII. The Mailed Warriors of the Sea, with ringed bodies and jointed feet.—IX. The Snare-Weavers and their Hunting Relations.—X. Insect Suckers and Biters, which change their coats but not their bodies. —XI. Insect Gnawers and Sippers, which remodel their bodies within their coats.—XII. Intelligent Insects with helpless Children, as illustrated by the Ants. [*In November.*

Second Edition, Crown 8vo, with 77 Illustrations, cloth, 7*s.* 6*d.*

A SHORT HISTORY OF NATURAL SCIENCE; AND OF THE PROGRESS OF DISCOVERY FROM THE TIME OF THE GREEKS TO THE PRESENT DAY. For the Use of Schools and Young Persons. By ARABELLA B. BUCKLEY, Authoress of "The Fairy-Land of Science," "Botanical Tables for the Use of Junior Students."

"It is an admirable book, written with a fulness and accuracy which is rarely to be found in compendiums of this sort. Any one who reads carefully to the end will have got a fair general notion of the vastness of physical science, and the means of pursuing more completely any special region of it which may be desired. It is an excellent book for young people, and one not to be despised by their elders."—*Guardian.*

Large post 8vo, with Illustrations and 21 Maps, cloth, 12*s.*

PHYSICAL, HISTORICAL, POLITICAL, AND DESCRIPTIVE GEOGRAPHY. By KEITH JOHNSTON, F.R.G.S., Editor of the "Africa" Volume in "Stanford's Compendium of Geography and Travel"; late Leader of the Royal Geographical Society's East African Expedition.

"It is a text-book of geography, revealing in its every page the author's thorough knowledge of the subject he deals with. It can be warmly recommended for the use of schools, and may be perused with profit and pleasure also by those whose school-days are passed, and whose knowledge of geography has grown somewhat misty and antiquated, but who, for these very reasons, are desirous of refreshing their memories, and of obtaining, within the limited time at their command, a general idea of the extent to which we are at present acquainted with the earth's surface features. Very ample details are given of the natural and industrial productions, and a set of maps very much enhances the interest of these descriptions, and conveys at a glance what even pages of letter-press would fail to render equally clear."—*Academy.*

Fcap. folio, 12*s.* 6*d.*

AN ATLAS OF ANATOMY. In Twenty-Four Quarto Coloured Plates, comprising One Hundred Separate Figures, with Descriptive Letterpress. By Mrs. FENWICK-MILLER, Member of the London School Board; Author of the Physiological Sections of "Simple Lessons for Home Use," &c.

"Mrs. Miller has made a most successful endeavour to encourage the general study of anatomy in a precise, and not in what would be termed a popular, form. This Atlas is a really systematic work on anatomy, and will, we believe, play no mean part in the diffusion of true, pure scientific knowledge."—*Athenæum.*

LONDON: EDWARD STANFORD, 55, CHARING CROSS, S.W.

SOME OF
MESSRS. MACMILLAN AND CO.'S
ANNOUNCEMENTS.

History of the Steam Engine.
By ROBERT L. GALLOWAY. With numerous Illustrations. Crown 8vo.

Graphical Determination of Forces in Engineering Structures. By J. B. CHALMERS. With Illustrations. 8vo.

Text-Book of Geology.
By ARCHIBALD GEIKIE, F.R.S., Professor of Geology, &c., in the University of Edinburgh. With Illustrations. Medium 8vo.

A Treatise on Chemistry.
By H. E. ROSCOE, F.R.S., and C. SCHORLEMMER, F.R.S., Professors of Chemistry in the Owens College, Manchester. With Illustrations. Vol. III. ORGANIC CHEMISTRY.

A Treatise on Comparative Embryology.
By F. M. BALFOUR, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. With Illustrations. Vol. II. 8vo.

Anthropology: an Introduction to the Study of Man and Civilisation. By E. B. TYLOR, F.R.S. With Illustrations. Crown 8vo.

Dr. Francis Sibson's Collected Works.
With Illustrations. Four Vols. 8vo.

Voyage of the "Vega."
By ADOLF ERIK NORDENSKIÖLD. With numerous Illustrations. Medium 8vo.

Island Life; or, the Phenomena of Insular Faunas and Floras, with their Causes, including an entire Revision of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. With Illustrations and Maps. Medium 8vo.

Ideal Chemistry.
By Sir BENJAMIN BRODIE, Bart, F.R.S. Crown 8vo.

Mathematical Papers.
By the late Professor W. K. CLIFFORD, F.R.S. 8vo.

The Aryan Village.
1. Modern Village Life in Bengal.—2. The Agricultural Community in Ceylon.—3. The Joint Family.—4. From the Joint Family to the Village. By Sir JOHN PHEAR. Crown 8vo.

Manual of Ancient Geography.
From the German of Dr. H. KIEPERT.

Exercises in Deductive Logic.
By W. STANLEY JEVONS, LL.D., F.R.S., Professor of Political Economy in University College, London. Crown 8vo.

Guide to the Study of Political Economy.
From the Italian of Dr. LUIGI COSSA, Professor in the University of Pavia. Crown 8vo.

Life and Letters of John T. Delane, late Editor of the *Times*. By Sir GEORGE W. DASENT, D.C.L. 8vo.

MACMILLAN AND CO., LONDON

Next week, in demy 8vo, price 24*s*.

AN INTRODUCTION
TO
THE STUDY OF FISHES.
BY
ALBERT C. L. G. GÜNTHER, M.A., M.D., PH.D., F.R.S.,
Keeper of the Zoological Department in the British Museum.

CONTENTS.

1. History and Literature.
2. External-Parts.
3. The Skeleton.
4. Myology.
5. Neurology.
6. The Organs.
7. Growth and Variation.
8. Palæontology.
9. Distribution.
10. Classification.
11. Collecting and Preserving.
12. Index.

ILLUSTRATED WITH 320 *WOOD ENGRAVINGS.*

Edinburgh: ADAM & CHARLES BLACK.

Fourth Edition, Revised, medium 8vo, cloth, 18*s*.

DESCHANEL'S NATURAL PHILOSOPHY. An Elementary Treatise. Translated and Extended by J. D. EVERETT, D C L., F.R S.E, Professor of Natural Philosophy in Queen's College, Belfast. Illustrated by 760 Wood Engravings and Three Coloured Plates, and accompanied by a Series of Problems.

Also, separately, in Four Parts, limp cloth, 4*s*. 6*d*. each.

Part I.—MECHANICS, HYDROSTATICS, and PNEUMATICS.
Part II.—HEAT. Part III —ELECTRICITY and MAGNETISM.
Part. IV.—SOUND and LIGHT.

"Systematically arranged, clearly written, and admirably illustrated, it forms a model work for a class in experimental physics"—*Saturday Review.*

Fcap. 8vo, cloth, 3*s* 6*d*.

ELEMENTARY TEXT-BOOK OF PHYSICS. By Prof. EVERETT, Translator and Editor of Deschanel's "Natural Philosophy," &c. Illustrated by numerous Woodcuts.

"We have no hesitation in warmly recommending it as a good text-book for junior classes."—*Nature.*

London: BLACKIE & SON, 49 and 50, Old Bailey.

Now ready, post quarto, cloth gilt, 272 pages. Price 16*s*.

LIGHTNING CONDUCTORS:
THEIR
HISTORY, NATURE, AND MODE OF APPLICATION.
By RICHARD ANDERSON, F.C.S, F G.S.,
Member of the Society of Telegraph Engineers; Assoc. Inst. C.E.
With numerous Illustrations.

"The book is one to be commended to the builders of, or dwellers in, lofty houses, to the deans of our cathedrals, to the parsons of churches with lofty spires or towers, and to all owners, constructors, or occupiers of buildings which, from their height or situation, are exposed to danger from lightning."—*The Athenæum*

"The book is clearly and sensibly written, and sufficiently illustrated, and is the work of a practical man who thoroughly understands what he is talking about."—*The Academy.*

London: E. & F. N. SPON, 46, Charing Cross.
New York. 446, Broome Street. 1880.

BRAIN:
A QUARTERLY JOURNAL OF NEUROLOGY.

PART XI. Price 3*s*. 6*d*.

Contents.

ORIGINAL ARTICLES:—
- Optical Illusions of Motion. By Prof. Silvanus P. Thompson, B A, D.Sc.
- On some Points in the Diagnosis and Treatment of Brain Diseases. By Julius Althaus, M.D.
- Recurrent Headaches in Children. By Francis Warner, M.D.
- On the Methods of Preparing, Demonstrating, and Examining Cerebral Structure in Health and Disease By Bevan Lewis, L R.C.P.
- Nervous Diseases in Victoria. By James Jamieson, M D.
- A Plea for the Minute Study of Mania. By J. Crichton-Browne, M.D.

CRITICAL DIGESTS AND NOTICES OF BOOKS:—
- Erlenmeyer on the Physiology and Pathology of Writing. By H. de Watteville, M.D.
- Brissaud on Hemiplegic Contracture. By David Ferrier, M D.
- Scientific Transcendentalism. By F. L Benham, M.D.
- Heidenhain on Animal Magnetism. By David Ferrier, M.D.

CLINICAL CASES:—
- Case of Progressive Muscular Atrophy. By Byrom Bramwell, M.D.
- Case of Compound Fracture of the Skull. By T. Pridgin Teale, M.A, Oxon.
- Case of Athetosis. By Lewis Shapter, M D.
- Case of Congenital Absence of the Corpus Callosum. By A. R. Urquhart, M D.

ABSTRACTS OF BRITISH AND FOREIGN JOURNALS.

MACMILLAN & CO., London.

The MORPHOLOGY of the SKULL. By W. K. PARKER, F.R.S., Hunterian Professor, Royal College of Surgeons, and G. T. BETTANY, B Sc., Lecturer on Botany in Guy's Hospital Medical School. Illustrated. Crown 8vo. 10*s*. 6*d*.

MACMILLAN & CO., London.

Extra fcap. 8vo, 3*s*. 6*d*.

METALS and their CHIEF INDUSTRIAL APPLICATIONS. By C. ALDER WRIGHT, D.Sc., Lecturer on Chemistry in St. Mary's Hospital Medical School. With Illustrations.

MACMILLAN & CO., LONDON.

PATERSON'S APPARATUS FOR LECTURES AND SCIENCE CLASSES.

New List of APPARATUS, LANTERNS, and LANTERN SLIDES for SCIENTIFIC LECTURES, with Terms of Hire. Post free.
Complete Sets of Physical Apparatus for Science Primers and all the Physical Text-books in use in Schools and Colleges.
Siemens and Gramme Dynamo Machines and Lamps for hire.
Schools supplied with Apparatus as per Science and Art Departments' Requirements in the Sections of Light, Heat, Sound, and Electricity.
Electric Signals for Houses, Hotels, &c., Colliery Signals, Lightning Conductors, Gower and other Patent Telephones.

EDWARD PATERSON,
ELECTRICAL ENGINEER AND SCIENTIFIC APPARATUS MANUFACTURER,
76, LITTLE BRITAIN, E.C., LONDON. STEAM WORKS—GRAY'S INN ROAD.
Illustrated Catalogue of Electrical Apparatus, Part 1, *post free,* 6 *Stamps. Ditto, Electric Signals, Part* 2, *post free,* 6 *Stamps.*

W. LADD & CO.,
SCIENTIFIC INSTRUMENT MANUFACTURERS,
(*By Appointment to the Royal Institution of Great Britain*),
11 AND 12, BEAK STREET, REGENT STREET, W.
IMPROVED HOLTZ ELECTRICAL MACHINES. GRAMME'S MAGNETO-ELECTRIC MACHINE for Laboratory use.
PHOSPHORESCENT POWDER—very brilliant—for Paint and other purposes, 3*s*. per oz.
Physical Apparatus of every Description.
ILLUSTRATED CATALOGUE, SIXPENCE.

RECENT SCIENTIFIC WORKS.

Crown 8vo, cloth, price 5*s.*

THE ATOMIC THEORY.

By Prof. AD. WURTZ.

Translated by E. CLEMINSHAW, F.C.S.

*** Vol. XXX. of "The International Scientific Series."

Second Edition, crown 8vo, cloth, price 5*s.*

THE BRAIN AS AN ORGAN OF MIND.

By H. CHARLTON BASTIAN, M.D., F.R.S.

With numerous Illustrations.

"The fullest scientific exposition yet published of the views held on the subject of psychology by the advanced physiological school."—*Athenæum.*

With numerous Illustrations, 2 vols. large post 8vo, cloth, price 32*s.*

THE HISTORY OF THE EVOLUTION OF MAN.

By Prof. ERNST HAECKEL.

"The appearance of the present fascinating work in an English dress will aid the cause of science in this country. . . Persons who wish to understand the real significance of their own structure should read this book; and as such a desire should be felt by all educated men, it is to be hoped that the book may soon reach a second edition"—*Athenæum.*

---

2 vols., Second Edition, post 8vo, cloth, price 32*s.*

THE HISTORY OF CREATION.

By Prof. ERNST HAECKEL.

Translation Revised by Prof. E. RAY LANKESTER, F.R.S.

With Coloured Plates and Genealogical Trees of the various Groups of both Plants and Animals.

"The author has discharged a most difficult task with conscientious skill and marvellous ability."—*Science Gossip.*

"A rich mine of facts for all biological students."—*Examiner.*

Crown 8vo, cloth, price 5*s.*

FREEDOM IN SCIENCE AND TEACHING.

From the German of ERNST HAECKEL.

With a Prefatory Note by T. H. HUXLEY, F.R.S.

Crown 8vo, cloth, price 2*s.* 6*d.*

ANIMAL MAGNETISM.

PHYSIOLOGICAL OBSERVATIONS BY RUDOLF HEIDENHAIN,

Professor of Physiology in the University of Breslau.

Translated from the Fourth German Edition by L. C. WOOLDRIDGE. With a Preface by G. R. ROMANES, F.R.S.

"The research of which this treatise is the outcome is in every way worthy of its distinguished author, for it serves not only to present a considerable and systematic body of carefully-observed facts, but also to lead the way for an indefinite amount of further inquiry along the lines that it has opened up."—Mr. G. R. ROMANES in the *Nineteenth Century.*

---

2 vols., demy 8vo, cloth, price 32*s.*

MIND IN THE LOWER ANIMALS IN HEALTH AND DISEASE.

By W. LAUDER LINDSAY, M.D., F.R.S.E.

Vol. I. MIND in HEALTH. Vol. II. MIND in DISEASE.

"In the present volumes all that the author attempts is to *outline* the subject of *mind in the lower animals* to illustrate their possession of the *higher mental faculties as they occur in man*, of *reason* as contradistinguished from mere *instinct.*"—*Introduction.*

With Illustrations, square 8vo, cloth, price 9*s.*

FLOWERS AND THEIR UNBIDDEN GUESTS.

By Dr. A. KERNER, Professor of Botany in the University of Innsbruck.

Translated Edition by W. OGLE, M.D., and a Prefatory Letter by CHARLES DARWIN, F.R.S.

"No more interesting chapter in the romance of natural history has been written than the one just contributed by Prof. Kerner."—*Academy.*

London: C. KEGAN PAUL & CO., 1, Paternoster Square.

MR. DAVID BOGUE'S LIST.

To be completed in Six Monthly Parts, price 10*s.* 6*d. each.*

Part I. now ready. Part II. will be published on NOVEMBER 1.

A MANUAL OF THE INFUSORIA:

INCLUDING A DESCRIPTION OF ALL KNOWN

FLAGELLATE, CILIATE, AND TENTACULIFEROUS PROTOZOA,

BRITISH AND FOREIGN,

And an Account of the

ORGANISATION AND AFFINITIES OF THE SPONGES.

By W. SAVILLE KENT, F.L.S., F.Z.S., F.R.M.S.,

Formerly Assistant in the Natural History Department of the British Museum.

This important work will consist of Two Volumes of Text extending to about 800 pages super-royal 8vo, and an Atlas of 48 Plates containing upwards of 2,000 Figures.

Imperial 8vo, cloth, 25*s.*

THE SPHAGNACEÆ,

OR,

PEAT MOSSES OF EUROPE AND NORTH AMERICA.

By R. BRAITHWAITE, M.D., F.L.S., &c.

Illustrated with 29 Plates Coloured by Hand.

Demy 8vo, cloth, 10*s.* 6*d.*

A NEW AND EASY METHOD OF STUDYING BRITISH WILD FLOWERS

BY NATURAL ANALYSIS:

Being a Complete Series of Illustrations of their Natural Orders and Genera Analytically arranged.

By FREDERICK A. MESSER.

Crown 8vo, cloth, 10*s.* 6*d.*

THE LAND AND FRESHWATER SHELLS OF THE BRITISH ISLES.

By RICHARD RIMMER, F.L.S.

Illustrated with Eight Photographs and Three Lithographs containing Figures of all the principal Species.

Early in November, Crown 8vo, cloth, 7*s.* 6*d*

UNCONSCIOUS MEMORY:

A COMPARISON BETWEEN

THE THEORY OF DR. EWALD HERING,

Professor of Physiology at the University of Prague,

AND

THE "PHILOSOPHY OF THE UNCONSCIOUS"

Of Dr. EDWARD VON HARTMANN;

With Translations from these Authors, and Preliminary Chapter bearing on "Life and Habit," and "Evolution Old and New."

By SAMUEL BUTLER,

AUTHOR OF

"Erewhon," "The Fair Haven," "Life and Habit," "Evolution Old and New," &c.

LONDON:
DAVID BOGUE, 3, ST. MARTIN'S PLACE, W.C.

BURDETT on COTTAGE HOSPITALS—GENERAL, FEVER, and CONVALESCENT; their Progress, Management, and Work. With Plans and Illustrations. Second Edition, Rewritten and much Enlarged. Crown 8vo. 14*s*.

HARDWICKE on MEDICAL EDUCATION and PRACTICE in all PARTS of the WORLD. 8vo. 10*s*.

DALBY on the EDUCATIONAL TREATMENT of INCURABLY DEAF CHILDREN. 8vo. 6*d*.

WILSON (W. S.) on the OCEAN as a HEALTH-RESORT. A Handbook of Practical Information as to Sea-Voyages for the Use of Tourists and Invalids. With Chart of Ocean Routes. Crown 8vo. 7*s*. 6*d*.

BENTLEY and TRIMEN'S MEDICINAL PLANTS: being Descriptions, with Original Figures, of the principal Plants employed in Medicine, and an Account of their Properties and Uses. In 4 vols., half morocco, with 306 Coloured Plates. Large 8vo. £11 11*s*.

HUXLEY'S MANUAL of COMPARATIVE ANATOMY. With Wood Engravings. VERTEBRATES, 12*s*.; INVERTEBRATES, 16*s*.

HOWARD on the MODIFICATIONS of CLOUDS. Third Edition, by W. D. and E. HOWARD. With 6 Plates, from Pictures by Kenyon. 4to. 10*s*. 6*d*.

MARTIN'S MANUAL of MICROSCOPIC MOUNTING; with Notes on the Collection and Examination of Objects. Second Edition, with 150 Illustrations. 8vo. 7*s*. 6*d*.

COOLEY'S CYCLOPÆDIA of PRACTICAL RECEIPTS AND COLLATERAL INFORMATION IN THE ARTS, Manufactures, Professions, and Trades, including Medicine, Pharmacy, Hygiene, and Domestic Economy. Designed as a comprehensive supplement to the Pharmacopœia and General Book of Reference for the Manufacturer, Tradesman, Amateur, and Heads of Families. Edited by Prof. TUSON, F.C.S., assisted by several Scientific Contributors. Sixth Edition, 2 vols. 8vo. 42*s*.

VALENTIN'S COURSE of QUALITATIVE ANALYSIS. Edited by W. R. HODGKINSON, Ph.D. (Würzburg), Demonstrator of Practical Chemistry in the Science Schools, South Kensington. Fifth Edition, with 19 Engravings. 8vo. 7*s*. 6*d*.

ALLEN'S INTRODUCTION to COMMERCIAL ORGANIC ANALYSIS. Vol. I., Cyanogen Compounds, Alcohols, and their Derivatives, Phenols, Acids, &c. 8vo. 10*s*. 6*d*.

TIDY'S HANDBOOK of MODERN CHEMISTRY, INORGANIC and ORGANIC. 8vo. 16*s*.

FOWNES' MANUAL of CHEMISTRY. Edited by HENRY WATTS, B.A., F.R.S. Twelfth Edition.

Vol. I.—PHYSICAL and INORGANIC CHEMISTRY. With 154 Engravings. Crown 8vo. 8*s*. 6*d*.

Vol. II.—ORGANIC CHEMISTRY. With Engravings. Crown 8vo. 10*s*.

BLOXAM'S CHEMISTRY, INORGANIC and ORGANIC. Fourth Edition, with 295 Engravings on Wood. 8vo. 16*s*.

BLOXAM'S LABORATORY TEACHING; or, Progressive Exercises in Practical Chemistry. Fourth Edition, with 89 Engravings. Crown 8vo. 5*s*. 6*d*.

BOWMAN'S PRACTICAL CHEMISTRY, including ANALYSIS. Edited by Prof. BLOXAM, Seventh Edition, with 98 Engravings. Fcap. 8vo. 6*s*. 6*d*.

LUFF'S INTRODUCTION to the STUDY of CHEMISTRY, specially designed for Medical and Pharmaceutical Students. Crown 8vo. 2*s*. 6*d*.

CLOWES' PRACTICAL and ANALYTICAL CHEMISTRY, specially adapted for Schools and Colleges, and for Beginners. Third Edition, with 48 Engravings, post 8vo. 7*s*. 6*d*.

KENSINGTON'S CHEMICAL COMPOSITION OF FOODS, Waters, Soils, Minerals, Manures, and Miscellaneous Substances. Fcap. 8vo. 5*s*.

EKIN on POTABLE WATER. How to form a Judgment on the Suitableness of Water for Drinking Purposes. Second Edition. Crown 8vo. 2*s*.

LONDON: 11, NEW BURLINGTON STREET.

ELEMENTARY CLASS-BOOKS OF SCIENCE.

ASTRONOMY, by the Astronomer-Royal.

POPULAR ASTRONOMY. With Illustrations. By Sir G. B. AIRY, K.C.B., Astronomer-Royal. New Edition. 18mo. 4*s.* 6*d.*

Six lectures, intended "to explain to intelligent persons the principles on which the instruments of an Observatory are constructed, and the principles on which the observations made with these instruments are treated for deduction of the distances and weights of the bodies of the Solar System."

ASTRONOMY.

ELEMENTARY LESSONS IN ASTRONOMY. With Coloured Diagram of the Spectra of the Sun, Stars, and Nebulæ, and numerous Illustrations. By J. NORMAN LOCKYER, F.R.S. New Edition. 18mo. 5*s.* 6*d.*

"Full, clear, sound, and worthy of attention, not only as a popular exposition, but as a scientific 'Index.'"—*Athenæum.*

QUESTIONS ON LOCKYER'S ELEMENTARY LESSONS IN ASTRONOMY. For the Use of Schools. By JOHN FORBES-ROBERTSON. 18mo, cloth limp. 1*s.* 6*d.*

PHYSIOLOGY.

LESSONS IN ELEMENTARY PHYSIOLOGY. With numerous Illustrations. By T. H. HUXLEY, F.R.S., Professor of Natural History in the Royal School of Mines. New Edition. 18mo. 4*s.* 6*d.*

"Pure gold throughout."—*Guardian.*

"Unquestionably the clearest and most complete elementary treatise on this subject that we possess in any language."—*Westminster Review.*

QUESTIONS ON HUXLEY'S PHYSIOLOGY FOR SCHOOLS. By T. ALCOCK, M.D. 18mo. 1*s.* 6*d.*

BOTANY.

LESSONS IN ELEMENTARY BOTANY. By D. OLIVER, F.R.S., F.L.S., Professor of Botany in University College, London. With nearly Two Hundred Illustrations. New Edition. 18mo. 4*s.* 6*d.*

CHEMISTRY.

LESSONS IN ELEMENTARY CHEMISTRY, INORGANIC AND ORGANIC. By HENRY E. ROSCOE, F.R.S., Professor of Chemistry in Owens College, Manchester. With numerous Illustrations and Chromo-Litho of the Solar Spectrum, and of the Alkalies and Alkaline Earths. New Edition. 18mo. 4*s.* 6*d.*

"As a standard general text-book it deserves to take a leading place."—*Spectator.*

"We unhesitatingly pronounce it the best of all our elementary treatises on Chemistry."—*Medical Times.*

A SERIES OF CHEMICAL PROBLEMS, prepared with Special Reference to the above, by T. E. THORPE, Ph.D., Professor of Chemistry in the Yorkshire College of Science, Leeds. Adapted for the preparation of Students for the Government, Science, and Society of Arts Examinations. With a Preface by Professor ROSCOE. New Edition, with Key, 18mo. 2*s.*

POLITICAL ECONOMY.

POLITICAL ECONOMY FOR BEGINNERS. By MILLICENT G. FAWCETT. New Edition. 18mo. 2*s.* 6*d.*

"Clear, compact, and comprehensive."—*Daily News.*

"The relations of capital and labour have never been more simply or more clearly expounded."—*Contemporary Review.*

LOGIC.

ELEMENTARY LESSONS IN LOGIC; Deductive and Inductive, with copious Questions and Examples, and a Vocabulary of Logical Terms. By W. STANLEY JEVONS, M.A. Professor of Logic in University College, London New Edition. 18mo. 3*s.* 6*d.*

"Nothing can be better for a school-book."—*Guardian.*

"A manual alike simple, interesting, and scientific."—*Athenæum.*

PHYSICS.

LESSONS IN ELEMENTARY PHYSICS. By BALFOUR STEWART, F.R.S., Professor of Natural Philosophy in Owens College, Manchester. With numerous Illustrations and Chromo-litho of the Spectra of the Sun, Stars, and Nebulæ. New Edition. 18mo. 4*s.* 6*d.*

"The beau-ideal of a scientific text-book, clear, accurate, and thorough."—*Educational Times.*

PRACTICAL CHEMISTRY.

THE OWENS COLLEGE JUNIOR COURSE OF PRACTICAL CHEMISTRY. By FRANCIS JONES, Chemical Master in the Grammar School, Manchester. With Preface by Professor ROSCOE, and Illustrations. New Edition. 18mo. 2*s.* 6*d.*

ANATOMY.

LESSONS IN ELEMENTARY ANATOMY. By ST. GEORGE MIVART, F.R.S., Lecturer in Comparative Anatomy at St. Mary's Hospital. With upwards of 400 Illustrations. 18mo. 6*s.* 6*d.*

"It may be questioned whether any other work on anatomy contains in like compass so proportionately great a mass of information."—*Lancet.*

"The work is excellent, and should be in the hands of every student of human anatomy."—*Medical Times.*

STEAM.

AN ELEMENTARY TREATISE. By JOHN PERRY, Bachelor of Engineering, Whitworth Scholar, &c., late Lecturer in Physics at Clifton College. With numerous Woodcuts and Numerical Examples and Exercises. 18mo. 4*s.* 6*d.*

"The young engineer and those seeking for a comprehensive knowledge of the use, power, and economy of steam, could not have a more useful work, as it is very intelligible, well arranged, and practical throughout."—*Ironmonger.*

PHYSICAL GEOGRAPHY.

ELEMENTARY LESSONS IN PHYSICAL GEOGRAPHY. By A. GEIKIE, F.R.S., Murchison Professor of Geology, &c., Edinburgh. With numerous Illustrations. 18mo. 4*s.* 6*d.*

QUESTIONS ON THE SAME. 1*s.* 6*d.*

NATURAL PHILOSOPHY.

NATURAL PHILOSOPHY FOR BEGINNERS. By I. TODHUNTER, M.A., F.R.S. Part I. The Properties of Solid and fluid Bodies. 18mo. 3*s.* 6*d.*

Part II. Sound, Light, and Heat. 18mo. 3*s.* 6*d.*

GEOGRAPHY.

CLASS-BOOK OF GEOGRAPHY. By C. B. CLARKE, M.A., F.G.S. New Edition, with eighteen coloured Maps. Fcap. 8vo. 3*s.*

"Contains a large amount of information, systematically arranged."—*Examiner.*

MACMILLAN AND CO., LONDON.

NOW READY.

THE FIRST PART OF THE NEW AND ENLARGED SERIES OF

THE MAGAZINE OF ART,

Being the **NOVEMBER** Part, Price 1s.

NOTICE.—Special attention is directed to the **FRONTISPIECE**, which is issued with this Part, consisting of an exquisitely-produced **ETCHING** entitled "**THE TRIO**," from the Painting by **ERSKINE NICOL, A.R.A.**, Etched by **LALAUZE**.

Cassell, Petter, Galpin, & Co., Ludgate Hill, London.

SOME OF CASSELL, PETTER, GALPIN & CO.'S NEW VOLUMES.

YOUNG IRELAND: A Fragment of Irish History. By the Hon. Sir Charles Gavan Duffy, K.C.M.G. Demy 8vo, cloth. 21s. [*Ready early in November.*

*** This book is a memoir of the few stormy years in Ireland during which O'Connell was tried and convicted of conspiracy, and Smith O'Brien tried and convicted of high treason, written by one who was in succession the fellow prisoner of each of them, and has since seen a remarkable career in Australia. The book is founded on the private correspondence of the leading men of the period, and purports to throw a searching light on the Irish politics of the present day.

A HISTORY OF MODERN EUROPE. By C. A. Fyffe, M.A., Fellow of University College, Oxford. Vol. I. From the Outbreak of the Revolutionary War in 1792, to the Accession of Louis XVIII. in 1814. Price 12s. [*Ready shortly.*

*** This new and original work will consist of three volumes, which will contain a history of Europe from the time of the French Revolution down to the present date. It will be written in a popular and attractive style, describing the general course of European History, and the most noteworthy events between the dates indicated, and showing the social, political, and commercial rise and decadence of the various nations of Europe.

FIGURE PAINTING IN WATER-COLOURS. With 16 Coloured Plates from Designs by BLANCHE MACARTHUR (Medallist, Royal Academy), and JEANIE MOORE (Medalist, Royal Academy), and with instructions by the Artists. Cloth. 7s. 6d. [*Ready Shortly.*

FAMILIAR GARDEN FLOWERS. *First Series.* By Shirley Hibberd, With 40 Coloured Plates by F. E. Hulme, F.L.S., F.S.A. 12s. 6d. [*Now ready.*

FAMILIAR WILD FLOWERS. *Second Series.* By F. E. Hulme, F.L.S., F.S.A., containing 40 Full-page Coloured Plates. 12s. 6d. [*Now ready.*

THE COUNTRIES OF THE WORLD. Vols. IV. and V. By Robert Brown, F.R.G.S. Illustrated. 7s. 6d. each. [*Now ready.*

THE MAGAZINE OF ART. Yearly Volume for 1880. With about 300 Illustrations by the first Artists of the Day, and Etching for Frontispiece. Handsomely bound in cloth gilt, gilt edges. 10s. 6d. [*Now ready.*

N.B.—The price of Vols. I. and II. has been raised from 7s. 6d. *to* 10s. 6d. *each.*

SCIENCE FOR ALL. Yearly Volume for 1880. With about 350 Illustrations and Diagrams. 9s.

Cassell, Petter, Galpin, & Co., Ludgate Hill, London.

CASSELL'S NEW NATURAL HISTORY. Edited by P. Martin Duncan M.B., F.R.S., Professor of Geology, King's College, London. Vols. I., II., III., and IV. Now Ready. Illustrated throughout. Extra crown 4to, cloth. 9s. each.

Vol. IV., JUST READY, contains—

Birds. By R. Bowdler Sharpe, F.L.S.—Reptiles (Tortoises, Crocodiles, Lizards, and Snakes). By Prof. P. Martin Duncan, F.R.S.—Amphibians. By Prof. P. Martin Duncan, F.R.S.

Vol. I. contains—

Apes and Monkeys. By Prof. P. M. Duncan.—Lemurs. By J. Murie, M.D., LL.D., F.L.S., F.G.S., and Prof. P. M. Duncan.—Chiroptera and Insectivora. By W. S. Dallas, F.L.S.

Vol. II. contains—

The Land Carnivora. By Prof. W. K. Parker, F.R.S., F.L.S., and Thomas Jeffrey Parker.—Marine Carnivora, Cetacea (Whales), and Sirenia (Manatee, Dugong, &c.). By James Murie, M.D., LL.D., F.L.S., F.G.S., —Proboscidea (Elephants).; Hyracoidea (Conies); Ungulata—Equidæ (Horses), Tapiridæ (Tapirs), Rhinocerotidæ (Rhinoceri), Suidæ (Hog Family), Hippopotamidæ (Hippopotami). By W. Boyd Dawkins, M.A., F.R.S., F.G.S., and [illegible] W. Oakley.

Vol. III. contains—

Uminantia. By Prof. A. H. Garrod, F.R.S.—Rodentia. By W. S. Dallas, F.L.S.—Edentata and Marsupialia. By Prof. P. Martin Duncan, F.R.S.—Aves. By R. Bowdler Sharpe, F.L.S.

Cassell, Petter, Galpin, & Co., Ludgate Hill, London.

MESSRS. MACMILLAN & CO.'S PUBLICATIONS.

Complete in Five Vols., price £6.

A SYSTEM OF MEDICINE.

Edited by J. RUSSELL REYNOLDS, M.D., F.R.S., &c.

Vol. I.—GENERAL DISEASES, or, AFFECTIONS of the WHOLE SYSTEM. 8vo. 25s.

Vol. II.—LOCAL DISEASES.—The NERVOUS SYSTEM.—The DIGESTIVE SYSTEM. 25s.

Vol. III.—LOCAL DISEASES.—The DIGESTIVE SYSTEM (continued).—The RESPIRATORY SYSTEM. 8vo. 25s.

Vol. IV.—LOCAL DISEASES.—DISEASES of the ORGANS of CIRCULATION.—The HEART. 21s.

Vol. V.—DISEASES of the ORGANS of CIRCULATION (continued).—The BLOOD-GLANDULAR SYSTEM.—URINARY ORGANS.—FEMALE REPRODUCTIVE ORGANS.—CUTANEOUS SYSTEM.—GENERAL INDEX, &c. 25s.

Also now publishing in Twenty-four Monthly Parts, price 5s. each. Parts 1 to 18 now ready.

Just published, in 8vo, price 18s. Vol. I.

COMPARATIVE EMBRYOLOGY: A TREATISE ON. By F. M. Balfour, M.A., F.R.S. With Illustrations. In 2 Vols.

Now ready, in 8vo, with Illustrations, price 18s., Vol. I.

A TEXT-BOOK OF THE PHYSIOLOGICAL CHEMISTRY OF THE ANIMAL BODY, INCLUDING AN ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE. By ARTHUR GAMGEE, M.D., F.R.S., Professor in the Victoria University, Manchester, Brackenbury Professor of Physiology in the Owens College. In 2 Vols.

INORGANIC CHEMISTRY: A TREATISE ON. By Professors Roscoe and Schorlemmer, of the Owens College, Manchester. With numerous Illustrations.

Vol. I.—The Non-Metallic Elements. 8vo. 21s. Vol. II.—Metals. Two Parts, 18s. each. [Organic Chemistry *in the Press.*

"It would be difficult to praise it too highly........The arrangement is clear and scientific, and the facts gained by modern research are fairly represented and judiciously selected, and the style throughout is singularly lucid."—*The Lancet.*

COMPARATIVE ANATOMY: ELEMENTS OF. By Prof. Gegenbaur. A Translation by F. J. Bell, B.A., revised with Preface by Prof. E. RAY LANKESTER, F.R.S. With numerous Illustrations. 8vo. 21s.

"We do not hesitate to say that this is the best and most complete work on comparative anatomy in the language. . . Any student who has made himself familiar with this work may consider that he possesses a sound elementary knowledge of animal morphology."—*The Lancet.*

THE PRACTITIONER'S HANDBOOK OF TREATMENT; OR, THE PRINCIPLES OF THERAPEUTICS. By J. MILNER FOTHERGILL, M.D., Assistant-Physician to the Victoria Park Hospital. 8vo. 16s.

"A practical and suggestive work."—*The Lancet.* [*Second Edition, Revised and Enlarged, now ready.*

The ANTAGONISM of THERAPEUTIC AGENTS, AND WHAT THEY TEACH US. By J. M. FOTHERGILL, M.D. Crown 8vo. 6s.

DISEASES OF THE SKIN: The Treatment of. By Dr. M'CALL ANDERSON. Crown 8vo. 5s.

LECTURES ON CLINICAL MEDICINE. By Dr. M'CALL ANDERSON. Illustrated. 8vo. 10s. 6d.

ON ANEURISM, ESPECIALLY of the THORAX AND THE ROOT OF THE NECK. By R. BARWELL, F.R.C.S. Crown 8vo. 3s. 6d.

ON PARALYSIS FROM BRAIN DISEASE IN ITS COMMON FORMS. By H. CHARLTON BASTIAN, M.D., F.R.S. Illustrated. Crown 8vo. 10s. 6d.

DISEASES OF THE EYE. By R. Brudenell Carter, F.R.C.S. With Illustrations. 8vo. 16s.

DEFECTS OF VISION WHICH ARE REMEDIABLE BY OPTIC APPLIANCES. By R. B. CARTER, F.R.C.S. Illustrated. 8vo. 6s.

EYESIGHT, GOOD AND BAD. By R. B. Carter, F.R.C.S. Second Edition. Crown 8vo. 6s.

PHYSIOLOGY AND PATHOLOGY OF THE BREAST and its LYMPHATIC GLANDS. By C. CREIGHTON, M.D. With Illustrations. 8vo. 9s.

THE GERM THEORY APPLIED TO THE EXPLANATION OF THE PHENOMENA OF DISEASE. By T. MACLAGAN, M.D. 8vo. 10s. 6d.

THE PATHOLOGY OF MIND. By H. Maudsley, M.D. New Edition, Revised and Enlarged. 8vo. 18s.

THE PHYSIOLOGY OF MIND. By H. Maudsley, M.D. New Edition, Revised and Enlarged. Crown 8vo. 10s. 6d.

BODY AND MIND. By H. Maudsley, M.D. New Edition, Enlarged. Crown 8vo. 6s. 6d.

THE PRACTITIONER: A JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH. Edited by T. L. BRUNTON, M.D., F.R.S. Price 1s. 6d. monthly.

Contents.—Original Communications, Reviews, Clinic of the Month, Extracts from the British and Foreign Journals, Notes and Queries, and Department of Public Health.

PHARMACOLOGY AND THERAPEUTICS; or, Medicine Past and Present. By T. LAUDER BRUNTON, M.D., F.R.S. Crown 8vo. 6s.

PHARMACOGRAPHIA: a History of the Principal Drugs of Vegetable Origin met with in Great Britain and India. By F. A. FLUCKIGER, M.D., and D. HANBURY, F.R.S. Second Edition, revised. 8vo. 21s.

TEXT-BOOK OF PHYSIOLOGY. By Michael Foster, M.D., F.R.S. With Illustrations. New Edition. 8vo. 21s.

THE CARE OF THE INSANE, AND THEIR LEGAL CONTROL. By J. C. BUCKNILL, M.D., F.R.S. Crown 8vo. 3s. 6d.

WATER SUPPLY. By J. H. Balfour Browne. Crown 8vo. 2s. 6d.

ELEMENTARY BIOLOGY. By Prof. Huxley and H. N. MARTIN. Crown 8vo. 6s.

PHYSIOGRAPHY: an Introduction to the Study of NATURE. By Prof. HUXLEY, F.R.S. With Coloured Plates and Woodcuts. New and Cheaper Edition. Crown 8vo. 6s. [*Just ready.*

THE MORPHOLOGY OF THE SKULL. By Prof. PARKER, F.R.S., and G. T. BETTANY, B.Sc. Illustrated. Crown 8vo. 10s. 6d.

THE OSTEOLOGY OF THE MAMMALIA. A Series of Lectures by Prof. W. H. FLOWER, F.R.S., F.R.C.S. Illustrations. Crown 8vo. 10s. 6d.

PRACTICAL CHEMISTRY FOR MEDICAL STUDENTS, specially arranged for the First M.B. Course. By M. M. PATTISON MUIR, F.R.S.E. 18mo. 1s. 6d.

ELEMENTARY LESSONS IN ANATOMY. By ST. GEORGE MIVART, F.R.S. With 400 Illustrations. 18mo. 6s. 6d.

LESSONS IN ELEMENTARY PHYSIOLOGY. By Prof. HUXLEY. Illustrated. New Edition. 18mo. 4s. 6d.

LESSONS ON PRESCRIPTIONS AND THE ART OF PRESCRIBING. By W. H. GRIFFITHS, Ph.D., L.R.C.P.E. New Edition. 18mo. 3s. 6d.

MACMILLAN AND CO., Bedford Street, Strand, W.C.

SUBSCRIPTIONS TO NATURE

DRAPER'S INK (DICHROIC).
THE NEW BLACK INK
DIFFERING FROM ANYTHING ELSE EVER PRODUCED.
Writing becomes a pleasure when this Ink is used. It has been adopted by the principal Banks, Public Offices, and Railway Companies throughout Ireland.
It writes almost instantly Full Black. | Flows easily from the Pen.
Does not corrode Steel Pens. | Blotting-paper may be applied at the
Is cleanly to use, and not liable to Blot. | moment of writing.
Can be obtained in London, through Messrs. BARCLAY & SONS, Farringdon Street; W. EDWARDS, Old Change; F. NEWBERY & SONS, Newgate Street; WM. MATHER, London and Manchester; J. AUSTIN & Co., Duke Street, Liverpool; and STACY & COOK, Paternoster Row; and to be had of all Stationers.
BEWLEY & DRAPER (Limited), Dublin.

ASTRONOMICAL TELESCOPE.
BATEMAN'S
WONDERFUL £5 5s. INSTRUMENT
Is the finest ever yet attempted. 3-inch Achromatic Object Lenses. Entirely constructed of polished brass; total length, 4 feet 10 inches; very highly finished with Altitude and Azimuth Movements, Rackwork, fine Adjustment, one Terrestrial and one Huyghenian Astronomical Eyepiece; will show Jupiter's Belts, Crescent Form of Venus, resolve many Nebulæ and Clusters, and divide many Double Stars, &c., &c. Prospectus post free.
J. BATEMAN,
29, CHEAPSIDE; 104, STRAND; ROYAL POLYTECHNIC, 309, REGENT STREET, AND 131, HIGH HOLBORN, LONDON.

Lately published.
EARLY MAN in BRITAIN, and his PLACE in the TERTIARY PERIOD. By W. BOYD DAWKINS, F.R.S., Professor of Geology in Owens College, Manchester. Medium 8vo, with numerous Illustrations. 25s.
MACMILLAN & CO., London.

STANDARD AND OBSERVATORY TIMEKEEPERS.

TRADE DENT MARK MANUFACTURED BY E. DENT & CO. TRADE DENT MARK

	Guineas.
Standard Clock, suitable for Private Residences in Town or Country, or Public Institutions, beating seconds and going eight days with once winding; in carved and decorated oak or mahogany case ... ... from	35
(*a*) The same, but going one month with once winding ... ... from	40
Standard Observatory Mean-time Clock	80
(*a*) The same, but furnished with electrical contact apparatus with eccentric screw adjustments for dropping a time ball, or transmitting hourly signals	92
Standard Observatory Sidereal Clock	80
(*a*) The same, but furnished with electrical contact apparatus with fine vertical and horizontal screw adjustments for transmitting seconds, currents for controlling other clocks, &c.	95
(*b*) The same, but arranged to omit the current at every 60th second, for pricking on chronograph barrel, &c.	97

	Guineas.
Standard Observatory Clock, of the most refined construction, with barometric compensation, &c. ...	160
(*a*) The same, with Sir Geo. Airy's escapement ...	170
(*b*) The same, with M. Leverrier's electrical contact system	200

The New Standard Clock (the primary standard timekeeper of the United Kingdom) of the Royal Observatory, Greenwich, was constructed by E. Dent & Co., and precisely similar instruments are now being made for the Royal Observatories of Spain and Belgium. Standard Clocks of less refined construction for the Observatories of Edinburgh (Royal), Dunsink (Royal Irish), Oxford (University), Pulkowa (Russian Imperial), Geneva (National Swiss); and many others, Foreign and Colonial, have been manufactured.

	Guineas.
Galvanic Chronographic Apparatus, for registering the time of occurrence of transits and other astronomical phenomena ... ... from	120

The Great Galvanic Chronograph of the Royal Observatory, Greenwich, and the still more powerful Apparatus for the Royal Observatory, Brussels, and other smaller ones for other Observatories were constructed by E. Dent & Co.

E. DENT & CO.,
WATCH, CLOCK, AND CHRONOMETER MAKERS,
61, STRAND, & 34, ROYAL EXCHANGE. FACTORY, GERARD STREET, LONDON.

CHEMICAL APPARATUS—SCIENTIFIC INSTRUMENTS.

Apparatus for the Analysis of Water according to Professors Frankland and Bischof.

BUNSEN'S MODIFIED FILTER PUMPS, from 10s. 8d. to 67s.

ELECTRIC LAMPS FROM 35s. UPWARDS, AND BATTERY OF 40 QUART BUNSEN'S CELLS FOR SAME AT £8.

GEISSLER'S TUBES.

Catalogues and Illustrations will be sent gratuitously. *A Liberal Discount allowed to Wholesale Buyers.*

Sets of Apparatus according to Professor Valentin's "Book of Chemistry," Professor Attfield's "Manual of Chemistry," &c., always in stock.

WHOLESALE IMPORTERS AND MANUFACTURERS,

AUG. BEL and CO.,

Sole Agents for Grenet's Batteries, and Contractors to the Government.

34, Maiden Lane, Southampton St., Strand, W.C.

Sets of Apparatus as required by the Government Schools always ready and kept in stock.

CAILLETET'S APPARATUS FOR LIQUEFACTION OF GASES.

For the convenience of Teachers and Students at the South Kensington Classes, the Science and Art Department has authorized us to keep a stock in the store room, first floor of the building, where the different sets and other articles are always ready for delivery.

PUBLICATIONS

OF THE

CAMBRIDGE UNIVERSITY PRESS.

MATHEMATICAL AND PHYSICAL PAPERS.

By GEORGE GABRIEL STOKES, M.A., D.C.L., LL.D., F.R.S., Fellow of Pembroke College, and Lucasian Professor of Mathematics in the University of Cambridge. Reprinted from the Original Journals and Transactions, with Additional Notes by the Author. Vol. I. Demy Octavo, cloth. 15s.

VOL. II. *In the Press.*

THE ELECTRICAL RESEARCHES OF THE

HONOURABLE HENRY CAVENDISH, F.R.S. Written between 1771 and 1781, Edited from the Original Manuscripts in the possession of the Duke of Devonshire, K.G. By J. CLERK MAXWELL, F.R.S. Demy 8vo, cloth. 18s.

A TREATISE ON NATURAL PHILOSOPHY.

By Sir W. THOMSON, LL.D., D.C.L., F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh. Vol. I. Part I. 16s.

"In this, the second edition, we notice a large amount of new matter, the importance of which is such that any opinion which we could form within the time at our disposal would be utterly inadequate."—*Nature.*

PART II. *In the Press.*

ELEMENTS OF NATURAL PHILOSOPHY. By

Professors Sir W. THOMSON and P. G. TAIT. Part I. 8vo, cloth. *Second Edition.* 9s.

THE ANALYTICAL THEORY OF HEAT. By

JOSEPH FOURIER. Translated, with Notes, by A FREEMAN, M.A., Fellow of St. John's College, Cambridge. Demy Octavo. 16s.

"There cannot be two opinions as to the value and importance of the *Théorie de la Chaleur.* It has been called 'an exquisite mathematical poem,' not once but many times, independently, by mathematicians of different schools. Many of the very greatest of modern mathematicians regard it, justly, as the key which first opened to them the treasure-house of mathematical physics. It is still *the* text-book of Heat Conduction, and there seems little present prospect of its being superseded, though it is already more than half a century old."—*Nature.*

A TREATISE ON THE THEORY OF DETER-

MINANTS AND THEIR APPLICATIONS IN ANALYSIS AND GEOMETRY. By ROBERT FORSYTH SCOTT, M.A., of St. John's College, Cambridge. Demy 8vo. 12s.

HYDRODYNAMICS. A Treatise on the Mathematical

Theory of the Motion of Fluids. By HORACE LAMB, M.A., formerly Fellow of Trinity College, Cambridge; Professor of Mathematics in the University of Adelaide. Demy 8vo. 12s.

LONDON: CAMBRIDGE WAREHOUSE, 17, PATERNOSTER ROW.

Printed by R. CLAY, SONS, AND TAYLOR, at 7 and 8, Bread Street Hill, Queen Victoria Street, in the City of London, and published by MACMILLAN AND CO., at the Office, 29 and 30, Bedford Street, Covent Garden.—THURSDAY, October 21, 1880.

GRAHAM MEDAL.

The TRIENNIAL GOLD MEDAL of the Chemical Section of the Philosophical Society of Glasgow, founded in commemoration of the work of THOMAS GRAHAM, F.R.S., late Master of the Mint, will be awarded at the end of the present Session for the Best Paper on any subject in Pure or Applied Chemistry.

Authors are requested to send in their Papers, not later than 1st February, 1881, addressed to the Secretary of the Section, Dr. J. J. DOBBIE, Chemical Laboratory, University of Glasgow.

SUNDAY LECTURE SOCIETY.

President.

W. B CARPENTER, Esq., C.B., LL.D., M.D., F.R S., &c.

Vice-Presidents.

Prof. Alexander Bain.
Charles Darwin, Esq., F R.S., F.L.S.
Edward Frankland, Esq., D.C.L., Ph.D, F.R.S.
James Heywood, Esq., F.R.S., F.S.A.
Sir Arthur Hobhouse, K C.S.I.
Thomas Henry Huxley, Esq, LL.D., F.R.S., F L S.
Benjamin Ward Richardson, Esq., M D., F R.S.
Herbert Spencer, Esq.
W Spottiswoode, Esq, LL.D., Pres. R S.
John Tyndall, Esq., LL.D., F.R.S.

The Society's Lectures will be resumed at St. George's Hall, Langham Place, on SUNDAY, the 31st October, each Afternoon at Four o'clock precisely.

October 31—W. B. CARPENTER, Esq, C.B., M.D., LL.D., F.R.S., on "The Science of Nature: what it is and what it is not."

Member's Annual Subscription, £1.

For Tickets, apply (by letter inclosing remittance) to the Hon Treasurer, WM. HENRY DOMVILLE, Esq., 15, Gloucester Crescent, Hyde Park, W.

Payment at the Door—One Shilling (Reserved Seats), Sixpence, and One Penny.

EVENING LECTURES to WORKING MEN. ROYAL SCHOOL OF MINES The first course of the Session, consisting of Six Lectures on Water by Prof Frankland, D.C L., F.R.S., will be delivered at the Science Schools, South Kensington, commencing on Monday, November 8th, at 8 o'clock. Tickets may be obtained by Working Men only at the Geological Museum, Jermyn Street, and at the South Kensington Museum on Monday next, November 1st, from 6 to 10 o'clock, p.m., on payment of a fee of 6*d.* for the Course Each applicant is requested to bring his name, address, and occupation written on a piece of paper, for which the Ticket will be exchanged.

F. W. RUDLER, Registrar.

The MUSEUM of PRACTICAL GEOLOGY in Jermyn Street will be re-opened on Monday next, November 1st, from 10 a.m. to 4 p.m. Open afterwards daily except on Fridays Admission Free.

By Order,
F. W. RUDLER, Curator.

WANTED.—QUARTERLY JOURNAL of MICROSCOPICAL SCIENCE for January, 1878; also *Journal of Anatomy* for May, 1869—Address offers to LIBRARIAN, University College, Gower Street.

FOR SALE.—"NATURE" (Unbound).—Vols. 16, 17, 18, and 21, and Nos. 471, 472, 473 (of Vol 19), and Nos. 512–522 (of Vol. 20), and No. 549.—READER, 29, Bedford Street, NATURE Office.

LORD RAYLEIGH'S COLOUR EXPERIMENT.

BROWNING'S MINIATURE SPECTROSCOPE

Will show that the brilliant orange-yellow of Lord Rayleigh's colour discs will give a spectrum which contains neither yellow nor orange; proving that yellow is not a primary but a compound colour.

This Instrument will also show many of Fraunhofer's lines, the bright lines of the metals and gases, and the absorption bands in coloured gases, crystals, or liquids.

Price, with Plain Slit, £1 2*s.*; ditto, with Adjustable Slit in Morocco Case, £1 15*s.*; ditto, with Achromatic Lenses, &c., &c., in Morocco Case, £2 6*s.*

An Illustrated Catalogue of Spectroscopes, Price Sixpence.

GEOLOGY AND MINERALOGY.

JOHN PYM has ready for Sale, at low prices, Educational Collections of Fossils, Rocks, and Minerals, specially arranged to illustrate the text-books of Lyell, Geikie, Bonney, Collins, Davies, Skertchley, Dana, Page, Jukes, &c. Series of Specimens for School and College Museums are also supplied at very reasonable prices. Catalogues post free.

Postal Address:—CASTLETON, *viâ* SHEFFIELD.

FIRST-CLASS AND THIRD-CLASS AWARDS

AT SYDNEY EXHIBITION

FOR COLLECTIONS FOR TEACHERS AND STUDENTS, OF

MINERALS, FOSSILS, AND ROCKS

Used with success by all Geological Science Teachers in the United Kingdom. Single Specimens, Hammers, and all requisites, of

JAMES R. GREGORY,

Geologists' Repository and Museum, 88, Charlotte Street, Fitzroy Square

New Lists of Collections, Apparatus, Rock Sections, &c., post free.

GEOLOGY.—In the Preface to the STUDENT'S ELEMENTS of GEOLOGY, by Lyell, 1874, he says: "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens, such as may be procured from Mr. TENNANT (149, Strand), Teacher of Mineralogy at King's College, London." These Collections are supplied on the following terms, in plain Mahogany Cabinets:—

	£	s.	d.
100 Specimens, in Cabinet, with 3 Trays	2	2	0
200 Specimens, in Cabinet, with 5 Trays	5	5	0
300 Specimens, in Cabinet, with 9 Drawers	10	10	0
400 Specimens, in Cabinet, with 13 Drawers	21	0	0

More extensive Collections at 50 to 5,000 Guineas each.

GALVANOPLASTIC CASTS

OF

STEGOCEPHALÆ (Labyrinthodontia).

The originals of the work "Fauna der Gaskohle," by Dr. Ant. Fritsch, are reproduced, with the microscopic details, allowing them to be studied with 20-fold magnifying glasses. The series now ready contains the genera Branchiosaurus, Sparodus, Dawsonia, Melanerpetan, Dolichosoma, and Ophiderpetan, and is to be had in London of CH. JAMRACH, 180, St. George Street, E. Price £5.

MINERALOGY AND GEOLOGY.

DOUBLY TERMINATED CRYSTALS OF EPIDOTE, Tyrol; CRYSTALS OF POLYCRASE, CORDIERITE, AUGITE, BONODOFFITE, Norway; METEORIC IRON, Estherville; APATITE, LAZULITE, RUTILE, ONTARIOLITE, STAUROLITE, AUGITE, TOURMALINE, QUARTZ, with Liquid, America; FINE POLISHED SLABS OF MICROLINE AND LABRADORITE.

COLLECTIONS FOR STUDENTS, from £2 2s. COLLECTIONS FOR BEGINNERS, from 4s. BLOWPIPE CASES AND APPARATUS.

PRIVATE LESSONS AND EVENING CLASSES.

Catalogues free.

SAMUEL HENSON,

277 (*Late* 113*a*), STRAND, LONDON.

Mr. HENSON'S usual Course of EVENING CLASSES will commence Tuesday, OCTOBER 12th, at 7.30.

---

50 ROCKS, 50 FOSSILS, 50 MINERALS,

NEATLY ARRANGED IN A

DEAL CABINET, STAINED AND POLISHED, LOCK AND KEY.

EACH SPECIMEN LABELLED AND CATALOGUED.

Price complete, £1 10s.

THE ROCKS illustrate the Order and Range of Deposition, &c.

JOHN MURRAY, Albemarle Street.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d*. By post 3½*d*. Annual Subscription, payable in advance, 14*s*.
Office—377, High Street, Edinburgh.
Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

THE ENTOMOLOGIST'S MONTHLY MAGAZINE.

Price Sixpence, Monthly, 24 pages 8vo, with occasional Illustrations.

Conducted by J. W. DOUGLAS, R. MCLACHLAN, F.R.S., E. C. RYE, F.Z.S. and H. T. STAINTON, F.R.S.

This Magazine, commenced in 1864, contains standard articles and notes on all subjects connected with Entomology, and especially on the Insects of the British Isles.

Subscription—Six Shillings per Volume, post free. The volumes commence with the June number in each year.

Vols. I. to V. (strongly bound in cloth) may be obtained by purchasers of the entire set to date, at the increased price of 10*s*. each; the succeeding vols. may be had separately or together, at 7*s*. each.

London: JOHN VAN VOORST, 1, Paternoster Row.

N.B.—Communications, &c., should be sent to the Editors at the above address.

"The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

Siemens and Gramme Dynamo Machines and Lamps for hire.
Schools supplied with Apparatus as per Science and Art Departments' Requirements in the Sections of Light, Heat, Sound, and Electricity.
Electric Signals for Houses, Hotels, &c., Colliery Signals, Lightning Conductors. The Gower-Bell Loud-speaking Telephone.

EDWARD PATERSON, Electrical Engineer.

SHOW ROOMS AND STEAM WORKS:—76, LITTLE BRITAIN, E.C. (late 3, Bedford Court, W.C.).

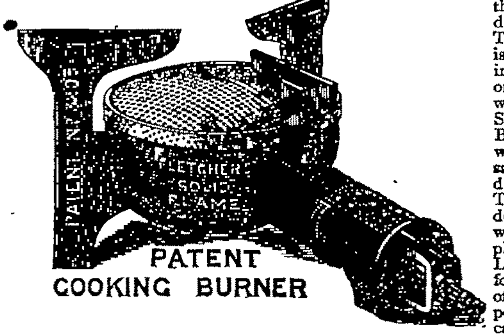
MOLISON'S HARMONOGRAPH; executes the Harmonic Curves in the most perfect manner. 15s. and 20s.

Illustrated Catalogue of Electrical Apparatus, Part 1, post free, 6 Stamps. Ditto, Electric Signals, Part 2, 6 Stamps.

FLETCHER'S PERFECTED SOLID FLAME GAS COOKING AND HEATING BURNER.

[PATENT, 3,203.]

The only perfect Burner for Cooking, Boiling, and Dirty Laboratory Work. Free from Smell, the most powerful Burner known, and not damaged by the roughest dirtiest work This Burner is a valuable improvement on Fletcher's well-known Solid Flame Burner, of which Thousands are in daily use. The Gauze is done away with and replaced by a Loose PerforatedDome of Solid Copper, which can be taken off and Cleaned when Choked with Dirt. The Stand is Broad and Firm, supporting Large or Small Vessels safely and steadily.



PRICE, Japanned, 6s. 6d.; Nickel-Plated, 8s. 6d.

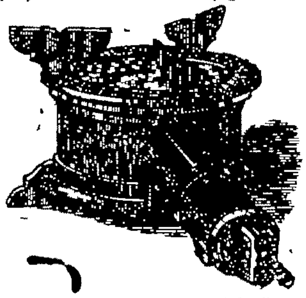
A SMALLER SIZE IN PREPARATION.

ORIGINAL SOLID FLAME BURNER.

PRICE, with Gauze, 4s.; or Nickel-Plated, 5s.

These Burners are the same power, and will with equal ease boil an Egg, cook a Chop, boil a Kettle, or melt half a hundredweight of Lead in an Iron Pot They will boil half a gallon of Water in a Flat Copper Kettle in Six Minutes, and work equally well with Air, Gas, or Coal-Gas.

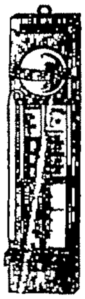
Complete Illustrated List, Price 3*d.*, of Gas Furnaces for Crucibles, Muffles, Ladles, Porcelain Painting, &c. Hot and Cold Blast Blowpipes; Foot, Hand, and Automatic Blowers, Ingot Moulds, &c.; with Reprint of Mr. Fletcher's Lecture to the Society of Arts *On the Application of Gaseous Fuel to Laboratory Work*, for which he was awarded the Society's Silver Medal in June, 1880.



THOS. FLETCHER,

4 & 6, *MUSEUM STREET, WARRINGTON.*

WANTED, Clean Copies of NATURE, No. 472, for November 14, 1878. Address—Office of NATURE, 29, Bedford Street, Strand.



DOLLOND,

1, Ludgate Hill, St. Paul's Churchyard.

ESTABLISHED 1750

Manufacturer of Astronomical and Terrestrial

TELESCOPES.

THE "EDUCATIONAL" ASTRONOMICAL TELESCOPE,

With 3-inch clear aperture. Complete, £7 17*s.* 6*d.*

N.B.—These Telescopes have been introduced to meet the wants of those wishing to purchase Instruments of excellent quality optically, while the exterior is sound and good, without the cost of high finish.

The New Short-length Mercurial Barometer and Thermometer combined, price 15*s.*, particulars of which will be sent post free on application.

FRY'S COCOA EXTRACT

GOLD MEDAL, PARIS EXHIBITION.

In Packets and Tins. Pure Cocoa only, with the superfluous oil extracted.

"If properly prepared, there is no nicer or more wholesome preparation of cocoa."—*Food, Water, and Air, edited by Dr. Hassall.*

J. S. FRY & SONS, Bristol and London.

On the 1st of every Month, price One Shilling.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., F.Z.S., Member of the British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of zoology; habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish; new or rare marine fish; local aquaria; British reptiles; British land and fresh-water mollusca, with remarks on the haunts and habits of the species; and other matters of general interest to those who delight in natural history. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign zoological journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

On the 1st of every Month.

TRIMEN'S JOURNAL OF BOTANY,

BRITISH AND FOREIGN.

New Series. Edited by JAMES BRITTEN, F.L.S., British Museum.

CONTENTS.—Original Articles by leading Botanists.—Extracts, and Notices of Books and Memoirs.—Articles in Journals.—Botanical News.—Proceedings of Societies.

Price 1*s.* 3*d.* Subscription for One Year, payable in advance, 12*s.*

London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

HOLLOWAY'S PILLS

THIS MEDICINE

Is a Certain Cure for all Disorders of the LIVER, STOMACH AND BOWELS. A Great PURIFIER of the BLOOD; a Powerful Invigorator of the System, in cases of WEAKNESS AND DEBILITY, and is unequalled in Female Complaints

MANUALS FOR STUDENTS.

INORGANIC CHEMISTRY. By Professors Roscoe and Schorlemmer. Vol. I.—Non-Metallic Elements. 21s. Vol. II.—Metals, 2 Parts. 18s. each.

GEGENBAUR'S COMPARATIVE ANATOMY. A Translation by F. J. Bell. Revised, with Preface, by Prof. Ray Lankester. Illustrated. 8vo. 21s.

TEXT-BOOK OF PHYSIOLOGY. By Michael Foster, M.D., F.R.S. Illustrated. 8vo. 21s.

A TREATISE OF EMBRYOLOGY. By F. M. Balfour, F.R.S. Illustrated. 8v Vol. I. 18s. [*Vol. II. in the press.*

A TEXT-BOOK OF PHYSIOLOGICAL CHEMISTRY. By Prof. Arthur Gamgee, F.R.S. Illustrated. 8vo. [*Vol. I. just ready.*

ELEMENTARY PRACTICAL PHYSIOLOGY. By Michael Foster, M.D., F.R.S., and J. N. Langley, B.A. Crown 8vo. 6s.

THE STUDENT'S FLORA OF THE BRITISH ISLANDS. By Sir J. D. Hooker, K.C.S.I., F.R.S. Globe 8vo. 10s. 6d.

PHYSIOGRAPHY: an Introduction to the Study of Nature. By Prof. Huxley, F.R.S. With Illustrations. Crown 8vo. New and Cheaper Edition. 6s. [*Just ready.*

ELEMENTARY BIOLOGY. By Prof. Huxley, F.R.S., assisted by H. N. Martin, M.B., D.Sc. Crown 8vo. 6s.

THE PRINCIPLES OF SCIENCE. A Treatise on Logic and Scientific Method. By Prof. W. Stanley Jevons, LL.D., F.R.S. Crown 8vo. 12s. 6d.

MANUAL OF POLITICAL ECONOMY. By Prof. Fawcett, M.P. Crown 8vo. 12s. 6d.

ELEMENTARY SCIENCE.

ASTRONOMY. By J. N. Lockyer, F.R.S. With Illustrations, 5s. 6d.—Questions, 1s. 6d.

BOTANY. By Prof. Oliver, F.R.S., F.L.S. With Illustrations, 4s. 6d.

CHEMISTRY. By Prof. Roscoe, F.R.S. With Illustrations, 4s. 6d.

CHEMICAL PROBLEMS ADAPTED TO THE SAME. By Prof. Thorpe. With Key, 2s.

CHEMISTRY. Owens College Junior Course of Practical Chemistry. By F. Jones. Preface by Prof. Roscoe. 2s. 6d.

QUESTIONS ON CHEMISTRY. By Francis Jones. 18mo. 3s.

LOGIC, DEDUCTIVE AND INDUCTIVE. By Prof. Jevons, F.R.S. 3s. 6d.

PHYSIOLOGY. By Prof. Huxley, F.R.S. With Illustrations. 4s. 6d.—Questions, 1s. 6d.

POLITICAL ECONOMY FOR BEGINNERS. By M. G. Fawcett. With Questions. 2s. 6d.

PHYSICS. By Prof. B. Stewart, F.R.S. With Illustrations. 4s. 6d.

NATURAL PHILOSOPHY FOR BEGINNERS. By I. Todhunter, M.A., F.R.S. Part I.—Properties of Solid and Fluid Bodies. 3s. 6d. Part II.—Sound, Light, and Heat. 3s. 6d.

PHYSICAL GEOGRAPHY. By Prof. A. Geikie, F.R.S. With Illustrations, 4s. 6d.—Questions, 1s. 6d.

CLASS-BOOK OF GEOGRAPHY. By C. B. Clarke, M.A., F.G.S. With Maps. 3s.

SOUND: an Elementary Treatise on. By Dr. W. H. Stone. Illustrated. 3s. 6d.

SCIENCE PRIMERS.

UNDER THE JOINT EDITORSHIP OF

Professors HUXLEY, ROSCOE, AND BALFOUR STEWART.

18mo, illustrated, 1s. each.

INTRODUCTORY. By Prof. Huxley, F.R.S.
CHEMISTRY. By Prof. Roscoe, F.R.S. With Questions.
PHYSICS. By Prof. B. Stewart, F.R.S. With Questions.
PHYSICAL GEOGRAPHY. By Prof. Geikie, F.R.S. With Questions.
GEOLOGY. By Prof. Geikie, F.R.S.
PHYSIOLOGY. By M. Foster, M.D., F.R.S.
ASTRONOMY. By J. N. Lockyer, F.R.S.
BOTANY. By Sir J. D. Hooker, K.C.S.I., F.R.S.
LOGIC. By Prof. Jevons, F.R.S.
POLITICAL ECONOMY. By Prof. Jevons.

MACMILLAN AND CO., LONDON.

SOME OF
MESSRS. MACMILLAN AND CO.'S
ANNOUNCEMENTS.

History of the Steam Engine.
By ROBERT L. GALLOWAY. With numerous Illustrations. Crown 8vo.

Graphical Determination of Forces in Engineering Structures. By J. B. CHALMERS. With Illustrations. 8vo.

Text-Book of Geology.
By ARCHIBALD GEIKIE, F.R.S., Professor of Geology, &c., in the University of Edinburgh. With Illustrations. Medium 8vo.

A Treatise on Chemistry.
By H. E. ROSCOE, F.R.S., and C. SCHORLEMMER, F.R.S., Professors of Chemistry in the Owens College, Manchester. With Illustrations. Vol. III. ORGANIC CHEMISTRY.

A Treatise on Comparative Embryology.
By F. M. BALFOUR, M.A., F.R.S., Fellow and Lecturer of Trinity College, Cambridge. With Illustrations. Vol. II. 8vo.

Anthropology: an Introduction to the Study of Man and Civilisation. By E. B. TYLOR, F.R.S. With Illustrations. Crown 8vo.

Dr. Francis Sibson's Collected Works.
With Illustrations. Four Vols. 8vo. Edited by W. M. ORD, M.D.

Voyage of the "Vega."
By ADOLF ERIK NORDENSKIÖLD. With numerous Illustrations. Medium 8vo.

Island Life; or, the Phenomena of Insular Faunas and Floras, with their Causes, including an entire Revision of the Problem of Geological Climates. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c. With Illustrations and Maps. Medium 8vo. 18*s.* [*Just ready.*

Ideal Chemistry.
By Sir BENJAMIN BRODIE, Bart., F.R.S. Crown 8vo. 2*s.* [*Just ready.*

Mathematical Papers.
By the late Professor W. K. CLIFFORD, F.R.S. 8vo.

The Aryan Village.
1. Modern Village Life in Bengal.—2. The Agricultural Community in Ceylon.—3. The Joint Family.—4. From the Joint Family to the Village. By Sir JOHN PHEAR. Crown 8vo.

Manual of Ancient Geography.
